Note: The term husband includes a partner with whom a woman is living as if married. Husband/intimate partner refers to the current husband for currently married women; the most recent husband for divorced, separated, or widowed women; the current intimate partner for never-married women who currently have an intimate partner; and the most recent intimate partner for never-married women who do not currently have an intimate partner but had one in the past. Total includes 1 woman whose husband's education and spousal education difference are missing. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Includes in the past 12 months

<sup>2</sup> Includes only currently married women

<sup>3</sup> According to the wife's report. Includes only currently married women. See Table 14.7 for list of decisions.

<sup>4</sup> According to the woman's report. See Table 13.9 for list of behaviors.

<sup>5</sup> According to the woman's report. See Table 14.8 for list of reasons.

**Table 13.17 Help seeking to stop violence**

Percent distribution of women age 15–49 who have ever experienced physical or sexual violence by their help-seeking behavior, according to type of violence and background characteristics, Tajikistan DHS 2023

Note: Women can report more than one source from which they sought help. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

### Key Findings

- **Employment:** 23% of currently married women age 15–49 are employed. The majority of women who are employed are paid in cash only (80%), and another 5% are paid in cash and in-kind.
- **Control over earnings:** 77% of currently married women with cash earnings participate in decisions about the use of their earnings; 31% decide on their own, and 46% decide jointly with their husbands.
- **Ownership of property:** 63% of women own a house alone or jointly with someone else. Over half of women who own a house have a title or deed with their name on it (54%).
- **Ownership and use of mobile phones and bank accounts:** Only 2% of women have a bank account that they use; 65% of women own a mobile phone. Only 14% of women used a mobile phone for financial transactions in the past 12 months.
- **Participation in decision making:** 36% of currently married women participate in three specific household decisions either alone or jointly with their husbands; 39% do not participate in any of the three decisions.
- **Attitudes toward wife beating:** Just under half of women (48%) agree with at least one justification for wife beating.
- **Negotiating sexual relations:** 62% of currently married women can say no to their husband if they do not want to have sexual intercourse, and 53% can ask their husband to use a condom.
- **Decision making regarding sexual and reproductive health:** 33% of currently married women say that they make their own informed decisions regarding sexual and reproductive health.

This chapter explores women's empowerment in terms of employment, earnings, control over earnings, and magnitude of earnings relative to those of their partners. The chapter also examines women's ownership of assets including houses and mobile phones as well as their use of bank accounts and mobile-money-service providers. In addition, responses to specific questions are used to define three different indicators of women's empowerment: women's participation in household decision making, women's attitudes towards wife beating, and women's participation in decision making regarding sexual and reproductive health.

## 14.1 MARRIED WOMEN'S EMPLOYMENT

### Employment

Respondents are considered to be employed if they have done any work other than their housework in the 12 months before the survey.

**Sample:** Currently married women age 15–49

### Earning cash for employment

Respondents are asked if they are paid for their labor in cash or in-kind. Only those who receive payment in cash only or in cash and in-kind are considered to earn cash for their employment.

**Sample:** Currently married women age 15–49 employed in the 12 months before the survey

Less than a quarter (23%) of currently married women age 15–49 in Tajikistan were employed in the 12 months prior to the survey. Among those employed, 80% are paid in cash only and 5% are paid both in cash and in-kind. Thirteen percent of currently married women who are employed are not paid at all (**Table 14.1**).

**Trends:** The percentage of currently married women employed in the past 12 months has declined since 2017, from 25% to 23%; however, the percentage earning only cash has increased, from 74% to 80%.

### Patterns by background characteristics

- Employment among currently married women generally increases with age; 5% of women age 15–19 are employed, as compared with 30% of those age 35–39 and 29% of those age 40–49 (**Figure 14.1**).
- The percentage of women who are paid for their work in cash only is highest among those age 40–44 (86%).

**Figure 14.1 Employment by age**

*Percentage of currently married women who were employed at any time in the 12 months before the survey*

## 14.2 CONTROL OVER WOMEN'S EARNINGS

### Control over one's own cash earnings

Respondents are considered to have control over their own earnings if they participate in decisions alone or jointly with their spouse about how their own earnings will be used.

**Sample:** Currently married women age 15–49 who received cash earnings for employment during the 12 months before the survey

Seventy-seven percent of currently married women age 15–49 with cash earnings decide on their own or jointly with their husbands how their earnings will be used. Thirty-one percent decide on their own how to use earnings, while 46% decide jointly with their husbands. Twenty-one percent of women report that their husband is the main decision maker, and 2% say that the primary decision maker is someone other than themselves or their husband (**Table 14.2.1** and **Figure 14.2**).

Eight percent of currently married women with cash earnings earn more than their husbands, and similarly 8% earn the same as their husbands. Eighty percent of women earn less than their husbands.

**Trends:** The percentage of women who decide on their own or jointly with their husband how they will use their earnings declined from 81% in 2012 to 71% in 2017 before increasing to 77% in 2023. The percentage of women earning more than their husbands increased from 8% in 2012 to 11% in 2017 before decreasing again to 8% in 2023.

#### Patterns by background characteristics

- The percentage of women who decide on their own how their cash earnings will be used increases from 22% among those age 20–24 to 34% among those age 35–39 and 40–44.
- The percentage of women who participate alone or jointly with their husbands in decisions about how their cash earnings are used varies from a low of 60% in Khatlon to a high of 93% in Dushanbe.
- Women’s participation in decisions about their own earnings tends to increase with increasing household wealth; 26% of women in the lowest wealth quintile decide on their own how their cash earnings will be used, as compared with 42% of women in the highest wealth quintile.
- Among currently married women who earn cash, the percentage who earn more than their husbands ranges from a low of 7% in Sughd to a high of 26% in Gorno-Badakhshan Autonomous Oblast (GBAO) (**Table 14.2.1**).

### 14.3 CONTROL OVER MEN’S EARNINGS

Seven percent of currently married women age 15–49 whose husbands have cash earnings report that they are the main decision maker about how their husband’s cash earnings are used, while 49% report that their husband mainly decides how his earnings are used. Notably, the likelihood of joint decision making by the wife and husband is lower for decisions about use of the husband’s earnings (38%) than about use of the wife’s earnings (46%).

The percentage of women who report that their husband mainly decides how his earnings are used is inversely proportional to educational level; 59% of women with no education or a primary education say that their husband decides how his earnings are used, as compared with 39% of women with a higher education (**Table 14.2.2**).

**Figure 14.2 Control over women’s earnings**

*Percent distribution of currently married women with cash earnings in the 12 months before the survey*

## 14.4 WOMEN'S OWNERSHIP OF ASSETS

### 14.4.1 Ownership of a House and Documentation of Ownership

#### Ownership of a house

Respondents who own a house, whether alone or jointly with their spouse, someone else, or both their spouse and someone else.

#### Documentation of ownership of a house

Respondents whose name is on the title/deed or other government-recognized document.

**Sample:** Women age 15–49

Overall, 63% of women age 15–49 own a house alone and/or jointly. Among them, 5% own a house alone, 56% own a house jointly with someone else, and 1% own a house both alone and jointly. Thirty-eight percent report they do not own a house (**Table 14.3** and **Figure 14.3**).

Documentation of ownership of a house is important with respect to security of tenure as well as the ability to leverage or liquidate the asset if needed. Among women who own a house, 54% possess a title or deed for the house with their name on it; 39% do not possess a title or deed (**Table 14.4**).

#### Patterns by background characteristics

- The percentage of women who do not own a house decreases with age, from 58% among those age 15–19 to 20% among those age 45–49 (**Table 14.4**).
- House ownership among women is most common in Sughd (72%) and least common in GBAO (51%).
- The percentage of women who own a house does not increase in a linear fashion with increasing household wealth; the percentage is higher among women in the third and fourth wealth quintiles (68% and 72%, respectively) than among women in the lower quintiles (52%–58%) or the highest quintile (61%).

### 14.4.2 Ownership and Use of Mobile Phones and Bank Accounts

#### Use of bank accounts or mobile-money-service providers

Respondents who have and use a bank account or who used a mobile phone for financial transactions in the 12 months before the survey.

**Sample:** Women age 15–49

Ownership of a bank account and a mobile phone are reflections of autonomy and financial independence. Women interviewed in the 2023 TjDHS were asked if they used an account in a bank or other financial institution and whether they owned a mobile phone. Very few women (2%) in Tajikistan have an account in a bank or other financial institution that they use. Sixty-five percent own a mobile phone (**Table 14.5** and **Figure 14.3**).

**Figure 14.3 Ownership of assets**

Women who own a mobile phone were asked if they use it for financial transactions. Among those who own a mobile phone, only 14% say that they used it for financial transactions in the past 12 months (**Table 14.5**).

#### Patterns by background characteristics

- Mobile phone ownership is higher in urban areas (79%) than in rural areas (60%). Among women who own a mobile phone, use of the phone for financial transactions is twice as high among urban women (23%) as among rural women (11%).
- By region, mobile phone ownership is highest in Dushanbe (87%) and lowest in Districts of Republican Subordination (DRS) and Khatlon (57% and 58%, respectively). Among women who own a mobile phone, the percentage who use the phone for financial transactions ranges from 7% in Khatlon to 34% in Dushanbe.
- Mobile phone ownership rises with increasing education and household wealth. Notably, 92% of women with a higher education have a mobile phone, a larger percentage than any other subgroup of women. Use of mobile phones for financial transactions also increases with increasing education and household wealth.
- Use of bank accounts is rare among women in all groups. Ownership and use of a bank account is more prevalent among women in Dushanbe (11%) and women with a higher education (9%) than among women in other subgroups.

## 14.5 PARTICIPATION IN DECISION MAKING

### Participation in major household decisions

Women are considered to participate in household decisions if they make decisions alone or jointly with their husband in all three of the following areas: (1) their own health care, (2) major household purchases, and (3) visits to their family or relatives.

**Sample:** Currently married women age 15–49

The 2023 TjDHS sought information from currently married women on their participation in three types of household decisions: their own health care, major household purchases, and visits to their family or relatives. Over half of married women (55%) participate in decisions regarding their own health, either mainly themselves (13%) or jointly with their husbands (42%); 41% participate in decisions on major household purchases, either mainly themselves (7%) or with their husbands (34%); and 51% participate in decisions to visit their families and relatives, either mainly themselves (12%) or with their husbands (39%) (**Table 14.6**). Thirty-six percent of women participate in all three specified household decisions either alone or jointly with their husbands. Thirty-nine percent of women do not participate in any of the three decisions (**Table 14.7**).

#### Patterns by background characteristics

- The percentage of women who participate in all three decisions increases steadily with age, from 16% among those age 15–19 to 52% among those age 45–49 (**Table 14.7**).
- Participation in all three decisions is higher among women who are employed for cash (45%) than among women who are not employed (34%) and women who are employed but do not earn cash (31%).
- By region, women's participation in all three decisions varies from a low of 21% in Sughd to a high of 58% in Dushanbe.
- Women's participation in all three decisions increases with increasing household wealth, from 30% among women in the lowest and second wealth quintiles to 45% among those in the highest quintile.

## 14.6 ATTITUDES TOWARD WIFE BEATING

### Attitudes toward wife beating

Respondents are asked if they agree that a husband is justified in hitting or beating his wife under each of the following five circumstances: she burns the food, she argues with him, she goes out without telling him, she neglects the children, and she refuses to have sex with him. If respondents answer “yes” in at least one circumstance, they are considered to have attitudes justifying wife beating.

**Sample:** Women age 15–49

In Tajikistan, 48% of women age 15–49 agree that a husband is justified in beating his wife in at least one of the five specified circumstances; 40% agree that wife beating is justified if she argues with her husband, 40% agree that it is justified if she goes out without telling him, and 37% agree that it is justified if she neglects the children. A smaller percentage of women agree that wife beating is justified if she burns the food (20%) or refuses to have sex with him (22%) (**Table 14.8** and **Figure 14.4**).

**Trends:** The percentage of women who agree with one or more justifications for wife beating decreased from 64% in 2017 to 48% in 2023.

### Patterns by background characteristics

- The belief that wife beating is justified is slightly lower among women who are not employed (47%) and those who are employed and paid in cash (49%) than among those who are employed but are not paid in cash (54%).
- The belief that wife beating is justified is lower among never-married women than among ever-married women; only 28% of women who have never been married agree that wife beating is justified in at least one of the five specified circumstances, as compared with 54% of married women and 40% of divorced, separated, or widowed women.
- More women in rural areas (51%) than urban areas (39%) agree with at least one reason for wife beating.
- Agreement with at least one reason for wife beating varies greatly by region, ranging from a low of 29% among women in GBAO and DRS to a high of 64% among women in Khatlon.
- Agreement with wife beating generally declines with increasing education and household wealth.

**Figure 14.4 Attitudes towards wife beating**

*Percentage of women age 15–49 who agree that a husband is justified in beating his wife for specific reasons*

## 14.7 NEGOTIATING SEXUAL RELATIONS

To assess attitudes toward negotiating safer sexual relations with husbands, women were asked whether they thought that a wife is justified in refusing to have sexual intercourse with her husband if she knows he has sex with other women and asking that he use a condom if she knows he has a sexually transmitted infection (STI).

Over half (55%) of women agree that a wife is justified in refusing to have sexual intercourse with her husband if her husband has other partners, and 49% agree that she is justified in asking her husband to wear a condom if he has an STI (**Table 14.9**).

To assess the ability of women to actually negotiate safer sexual relations with their husband, women were asked whether they could say no to their husband if they do not want to have sexual intercourse and whether they could ask their husband to use a condom. Sixty-two percent of women reported that they can say no to their husband if they do not want to have sex, and 53% reported that they can ask their husband to use a condom (**Table 14.10**).

### Patterns by background characteristics

- Currently married women's ability to negotiate safer sex varies only minimally by age. Sixty percent of women age 15–24 report that they can say no to their husband if they do not want to have sexual intercourse, as compared with 64% of women age 40–49.
- Women's ability to negotiate safer sex with their husband varies by region. The percentage of women who can say no to their husband if they do not want to have sexual intercourse ranges from 54% in Khatlon to 75% in GBAO, and the percentage who can ask their husband to use a condom varies from 43% in Khatlon to 68% in GBAO.
- The percentage of women who say that they can negotiate safer sex with their husband is higher in urban than rural areas.

## 14.8 WOMEN'S PARTICIPATION IN DECISION MAKING REGARDING SEXUAL AND REPRODUCTIVE HEALTH

### **Informed decision making on sexual relations, contraceptive use, and reproductive health**

Women are considered to make their own informed decisions on sexual relations, contraceptive use, and reproductive health if (1) they can say no to their husband if they do not want to have sexual intercourse, (2) they make decisions about use of family planning alone or jointly with their husband, and (3) they make decisions about their own health care alone or jointly with their husband.

**Sample:** Currently married women age 15–49

One-third (33%) of currently married women age 15–49 report making their own decisions regarding sexual relations, contraceptive use, and reproductive care (**Table 14.11**).

## Patterns by background characteristics

- The percentage of currently married women who report making their own decisions regarding sexual relations, contraceptive use, and reproductive care increases from 18% among those age 15–19 to 40% among those age 45–49 (**Figure 14.5**).
- By region, the percentage of women who report making their own decisions regarding sexual relations, contraceptive use, and reproductive care ranges from 23% in Khatlon to 58% in GBAO.
- Women's participation in decision making regarding sexual and reproductive health generally increases with increasing education and household wealth. Twenty-four percent of women with no education or a primary education report making their own decisions regarding sexual relations, contraceptive use, and reproductive care, as compared with 45% of women with a higher education. Similarly, 27% of women in the lowest wealth quintile report making their own decisions, compared with 45% of women in the highest quintile.

Note: The term husband includes a partner with whom a woman is living as if married. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

**Table 14.2.2 Control over men's cash earnings**

Percent distribution of currently married women age 15–49 whose husbands receive cash earnings by person who decides how husband's cash earnings are used, according to background characteristics, Tajikistan DHS 2023

| Background characteristic        | Mainly wife | Wife and husband jointly | Mainly husband | Other | Total | Number of women |

Note: The term husband includes a partner with whom a woman is living as if married.

**Table 14.9 Attitudes toward negotiating safer sexual relations with husband**

Percentage of women age 15–49 who believe that a woman is justified in refusing to have sexual intercourse with her husband if she knows that he has sexual intercourse with other women, and percentage who believe that a woman is justified in asking that they use a condom if she knows that her husband has a sexually transmitted infection (STI), according to background characteristics, Tajikistan DHS 2023

| Background characteristic   | Woman is justified in:                                                                        |                                                                        | Number of women |
|-----------------------------|-----------------------------------------------------------------------------------------------|------------------------------------------------------------------------|-----------------|
|                             | Refusing to have sexual intercourse with her husband if she knows he has sex with other women | Asking that they use a condom if she knows that her husband has an STI |                 |

<sup>1</sup> Percentages of currently married women who make decisions regarding sexual relations, contraceptive use, and health care are presented in Table 14.10, Table 7.15, and Table 14.7, respectively.

## Key Findings

- **Drinking water sources, availability, and treatment:** 93% of de jure household members have at least basic drinking water service, 52% report that they have had sufficient quantities of drinking water in the past month, and 93% use an appropriate treatment method to make their water safer to drink.
- **Sanitation:** Nearly all household members use an improved sanitation facility (99%), and none engage in open defecation.
- **Management of excreta:** 98% of household members manage and dispose of their excreta safely.
- **Disposal of children's stools:** 14% of children's stools are disposed of appropriately.
- **Handwashing:** Overall, 79% of the household population has access to a basic handwashing facility.
- **Menstrual hygiene:** 76% of women use cloth during their menstruation; nearly all women (98%) were able to wash and change in privacy during their most recent menstruation.

The extent to which households have access to and use safe drinking water and sanitation facilities and engage in hygienic practices has profound implications for the health, safety, and overall well-being of the population. This chapter presents information on source of drinking water, type of sanitation facility, disposal of excreta (including disposal of young children's stools), handwashing, and menstrual hygiene.

## 15.1 DRINKING WATER SOURCES, AVAILABILITY, AND TREATMENT

**Improved sources of drinking water**

Include piped water, public taps, standpipes, tube wells, boreholes, protected dug wells and springs, rainwater, water delivered via a tanker truck or a cart with a small tank, and bottled water.

**Sample:** Households and de jure population

In Tajikistan, 94% of the de jure population has access to an improved source of drinking water (**Table 15.1**). The majority of household residents have drinking water piped into their dwelling, yard, or plot (63%). Nine percent obtain water through tube wells or boreholes and 8% through public taps or standpipes. Only 1% of the population uses drinking water from an unimproved source, while 5% uses surface water.

Higher percentages of the population in rural areas use unimproved sources and surface water (2% and 7%, respectively) than the population in urban areas (less than 1% each).

**Trends:** The percentage of the population with access to an improved source of drinking water has increased gradually over the years, from 81% in 2012 and 84% in 2017 to 94% in 2023.

The percentage of the population with water on the premises has increased substantially over the past decade, from 46% in 2012 to 66% in 2017 and 88% in 2023.

### 15.1.1 Drinking Water Service Ladder

#### Drinking water service ladder

##### Safely managed

Drinking water from an improved water source that is located on the premises, available when needed, and free from fecal and priority chemical contamination.

##### Basic

Drinking water from an improved source, provided either water is on the premises or round-trip collection time is 30 minutes or less.

##### Limited

Drinking water from an improved source, and round-trip collection time is more than 30 minutes.

##### Unimproved

Drinking water from an unprotected dug well or unprotected spring.

##### Surface water

Drinking water directly from a river, dam, lake, pond, stream, canal, or irrigation canal.

**Sample:** De jure population

Building off the classification of drinking water sources as improved or unimproved, the Joint Monitoring Programme for Water Supply, Sanitation and Hygiene (JMP) has devised a five-rung drinking water service ladder to benchmark and compare progress towards achieving Sustainable Development Goal (SDG) targets (WHO/UNICEF 2018). The 2023 TjDHS captured information on four out of the five rungs; because the survey did not include testing drinking water for fecal or chemical contamination, safely managed and basic drinking water services cannot be distinguished and are grouped together in **Table 15.2** as “at least basic service.”

Ninety-three percent of the de jure population has access to at least basic drinking water service (**Table 15.2** and **Figure 15.1**).

**Trends:** The population living in households with at least basic water service increased from 78% in 2012 and 84% in 2017 to 93% in 2023.

#### Patterns by background characteristics

- A higher percentage of the urban population than the rural population has access to at least basic drinking water service (99% versus 91%), while a higher percentage of the rural population uses surface water (7% versus less than 1%).

**Figure 15.1 Household population drinking water service by residence**

Percent distribution of de jure population by drinking water service ladder

- All residents in Dushanbe have access to at least basic drinking water service (**Map 15.1**).

- Six percent of the population living in Gorno-Badakhshan Autonomous Oblast (GBAO) uses an unimproved drinking water source. Twelve percent of the population in Khatlon uses surface water.

- Access to at least basic drinking water service increases from 85% among the population in the lowest wealth quintile to almost 100% among the population in the highest quintile.

**Map 15.1 At least basic drinking water service by region**

*Percentage of household population with at least basic drinking water service*

### 15.1.2 Person Collecting Drinking Water

Twelve percent of the de jure population lives in households without drinking water on the premises (**Table 15.3**), and the majority of these residents use unimproved water sources (69%). In households without drinking water on the premises, water is usually collected by an adult female age 15 or older (70%), followed by an adult male age 15 or older (20%), a male child under age 15 (5%), and a female child under age 15 (4%) (**Figure 15.2**).

#### Patterns by background characteristics

- Fifteen percent of the rural population lives in a household without drinking water on the premises, as compared with 6% of the urban population. The variation in participation in drinking water collection between adult females and adult males is larger in rural areas (72% and 18%, respectively) than in urban areas (55% and 36%, respectively).
- By region, the percentage of the population living in households without drinking water on the premises is lowest in Dushanbe (less than 1%) and highest in Sughd (26%).
- In GBAO, there is almost equal participation by adult females and adult males in collection of drinking water (48% and 47%, respectively), while in Khatlon 89% of adult females and only 4% of males collect water.
- The percentage of the de jure population without drinking water on the premises decreases with increasing household wealth, from 24% in the lowest wealth quintile to 2% in the highest wealth quintile.

**Figure 15.2 Person collecting drinking water**

*Among de jure household population without drinking water on premises, percent distribution by person who collects drinking water*

### 15.1.3 Availability of Drinking Water

#### Availability of sufficient drinking water

Percentage of the population with sufficient quantities of drinking water in the past month.

**Sample:** De jure population

Only 52% of the population has sufficient quantities of drinking water (Table 15.4).

#### Patterns by background characteristics

- The percentage of the population reporting sufficient quantities of drinking water is the same in rural and urban areas (52%).
- Sixty-eight percent of the population in Dushanbe has sufficient drinking water, as compared with 44% in Sughd.
- Just over half of improved water sources (52%) are available in sufficient quantities, compared with 40% of unimproved sources.
- The percentage of the population with sufficient quantities of drinking water increases from 47% in the lowest and second wealth quintiles to 56% in the highest quintile (Figure 15.3).

**Figure 15.3 Availability of sufficient quantities of drinking water by household wealth**

*Percentage of household population with sufficient quantities of drinking water in the past month*

### 15.1.4 Treatment of Drinking Water

In Tajikistan, 93% of the population uses an appropriate method (boiling, bleaching, filtering, or solar disinfecting) to treat household drinking water. Boiling water is by far the most common method of water treatment (92%). The percentage of the population using appropriate water treatment methods is high across all drinking water sources. The percentage of the population using an appropriate method is much lower in GBAO (39%) than in the other regions (89%–98%) (Table 15.5).

**Trends:** The percentage of the population using appropriate drinking water treatment methods increased from 85% in 2012 to 93% in 2017 and 2023.

## 15.2 SANITATION

#### Improved sanitation facilities

Include flush/pour flush toilets that flush water and waste to a piped sewer system, septic tank, pit latrine, or unknown destination; ventilated improved pit (VIP) latrines; pit latrines with slabs; and composting toilets.

**Sample:** Households and de jure population

Nearly the entire de jure population in Tajikistan reported having an improved sanitation facility (99%) (Table 15.6). Most sanitation facilities are pit latrines with slabs (80%) and are located in the household's own yard or plot (83%) rather than in the dwelling (17%). Only 2% of the population reported having an unimproved sanitation facility, and no open defecation was reported.

**Trends:** The percentage of the population with an improved sanitation facility has remained high over the past decade, ranging from 97% in 2012 to 99% in 2017 and 2023.

## 15.2.1 Sanitation Service Ladder

### Sanitation service ladder

#### Safely managed

Use of improved facilities that are not shared with other households and where excreta are safely disposed of in situ or transported and treated off-site.

#### Basic

Use of improved facilities that are not shared with other households.

#### Limited

Use of improved facilities shared by two or more households.

#### Unimproved

Use of pit latrines without a slab or platform, hanging latrines, or bucket latrines.

#### Open defecation

Disposal of human feces in fields, forests, bushes, open bodies of water, beaches, or other open spaces or with solid waste.

**Sample:** De jure population

The JMP has also devised a five-rung sanitation service ladder to benchmark and compare progress towards achieving SDG targets related to sanitation. The 2023 TjDHS captured information about all five rungs. However, for those households whose excreta were taken off-site, it is not possible to know if they were treated appropriately; therefore, safely managed and basic sanitation services are grouped together in **Table 15.7** as “at least basic service.”

Overall, 97% of the population has at least basic sanitation service, 1% has limited service, and 2% has unimproved service; no open defecation was reported (**Figure 15.4**).

**Trends:** The percentage of the population with at least basic sanitation service increased from 94% in 2012 to 97% in 2017 and 2023.

### Patterns by background characteristics

- By region, the percentage of the population with at least basic service is lowest in GBAO (93%) and highest in Khatlon (98%).
- The percentage of the population with at least basic sanitation service is high in both rural (98%) and urban (96%) areas and across wealth quintiles (97–98%).

**Figure 15.4 Household population sanitation service by residence**

*Percent distribution of de jure population by sanitation service ladder*

## 15.2.2 Removal and Disposal of Excreta

### Disposal of excreta from on-site facilities

#### Excreta safely disposed of in situ

Includes septic tanks and latrines in which waste is buried in a covered pit, waste is never emptied, and it is unknown if waste is ever emptied.

#### Excreta disposed of unsafely

Includes septic tanks and latrines in which waste is emptied to uncovered pits, open ground, a water body, or other locations.

#### Excreta removed for treatment

Includes septic tanks and latrines in which waste is removed by a service provider to a treatment plant or an unknown location or is removed by a non-service provider to an unknown location.

**Sample:** De jure population with on-site sanitation facilities (septic tanks, pit latrines, and composting toilets)

Information on the disposal of excreta from sanitation facilities that are not connected to a sewer system is essential for assessing the percentage of the population using safely managed sanitation services.

Overall, 91% of the population with improved, on-site sanitation facilities had excreta safely disposed of in situ. For 8% of the population with on-site sanitation facilities, excreta were removed for treatment, while less than 1% had excreta disposed of unsafely (**Table 15.8**).

**Table 15.9** presents information on appropriate management of household excreta. Nearly all residents (98%) live in households that appropriately manage household excreta; 15% have sanitation facilities connected to a sewer, 79% safely dispose of excreta on-site, and 4% have excreta removed for treatment off-site.

### Patterns by background characteristics

- Appropriate management of household excreta is high in both urban (99%) and rural (97%) areas, in all regions (95%–99%), and across wealth quintiles (96%–99%).
- Fifty-four percent of the urban population lives in households with sanitation facilities that are connected to a sewer, as compared with only 1% of the rural population.
- Eighty-one percent of the population in Dushanbe lives in households with sanitation facilities connected to a sewer, compared with less than 10% of the population in the other regions.

## 15.3 DISPOSAL OF CHILDREN'S STOOLS

### Appropriate disposal of children's stools

The child's last stools were put or rinsed into a toilet or latrine, or the child used a toilet or latrine.

**Sample:** Youngest children under age 2 living with their mother

Proper disposal of human waste is important to prevent diseases transmitted through feces. Only 14% of children under age 2 living with their mother had their last stool disposed of appropriately. Ten percent of children's last stools were put/rinsed into a toilet or latrine, an appropriate method of disposal, while 84% were thrown into the garbage and 2% were buried, the two most common inappropriate methods (**Table 15.10**).

## 15.4 HANDWASHING

### Handwashing facilities

#### Basic

Availability of a handwashing facility on the premises with soap and water.

#### Limited

Availability of a handwashing facility on the premises without soap and water.

**Sample:** De jure population for whom a place for handwashing was observed or with no place for handwashing in dwelling, yard, or plot; excludes the de jure population for whom permission to see the facility was not granted

Handwashing is an important step in monitoring hygiene and preventing the spread of disease. Rather than asking direct questions on the practice of handwashing, which can be subject to overreporting, interviewers asked to see the place where members of the household most often washed their hands. A place for washing hands was observed for 96% of the de jure population (**Table 15.11**). Of the handwashing places observed, 89% were in a fixed location and 8% were mobile.

According to the definitions of handwashing facilities developed by the JMP, 79% of the population had a basic handwashing facility and 17% had a limited handwashing facility.

## 15.5 MENSTRUAL HYGIENE

### Appropriate menstrual hygiene materials

Reusable sanitary pads, disposable sanitary pads, tampons, menstrual cup, cloth, toilet paper, and/or cotton wool.

**Sample:** Women age 15–49 with a menstrual period in the past year

### Privacy and use of appropriate menstrual hygiene materials

Percentage of women who were able to wash and change in privacy and who used appropriate materials during their most recent menstruation.

**Sample:** Women age 15–49 with a menstrual period in the past year who were home during their most recent menstrual period

Using appropriate menstrual hygiene materials is important for women's health in general and their menstrual health in particular. In the 2023 TjDHS, women age 15–49 were asked what materials they use for menstrual hygiene. Seventy-six percent of women use cloth, 24% use disposable pads, 8% use reusable pads, and 2% use tampons (**Table 15.12**).

Women were also asked if they were able to wash and change in privacy during their most recent menstrual period; nearly all respondents (98%) reported that they were able to do so. Overall, 98% of women were able to wash and change in privacy and used appropriate materials during their most recent menstrual period (**Table 15.12**).

### Patterns by background characteristics

- A higher percentage of women in urban than rural areas use disposable pads (36% versus 19%) and reusable pads (16% versus 5%), while a higher percentage of women in rural areas use cloth (81% versus 62%).
- The percentage of women reporting that they can wash or change in privacy varies only minimally by age, residence, region, education, and wealth.

## LIST OF TABLES

For more information on water and sanitation characteristics, see the following tables:

Note: Service ladder concept/definitions are based on the WHO/UNICEF Joint Monitoring Programme for Water Supply, Sanitation and Hygiene (JMP).

<sup>1</sup> Defined as drinking water from an improved source, provided either water is on the premises or round-trip collection time is 30 minutes or less. Includes safely managed drinking water, which is not shown separately.

<sup>2</sup> Drinking water from an improved source, and round-trip collection time is more than 30 minutes or is unknown

<sup>3</sup> Drinking water from an unprotected dug well or unprotected spring

**Table 15.3 Person collecting drinking water**

Percentage of de jure population in households without drinking water on premises, and percent distribution of de jure population in households without drinking water on premises by the person who usually collects drinking water used in the household, according to background characteristics, Tajikistan DHS 2023

| Background characteristic       | Percent-age of de jure population without drinking water on premises <sup>1</sup> | Number of persons | Person who usually collects drinking water |                            |                           |                         |                         | Total | Number of persons without drinking water on premises <sup>1</sup> |

Note: Service ladder concept/definitions are based on the WHO/UNICEF Joint Monitoring Programme for Water Supply, Sanitation and Hygiene (JMP).

<sup>1</sup> Defined as use of improved facilities that are not shared with other households. Includes safely managed sanitation service, which is not shown separately.

<sup>2</sup> Defined as use of improved facilities shared by two or more households

<sup>3</sup> Use of flush/pour flush toilet not to sewer, septic tank, or pit latrine; pit latrine without a slab/open pit; hanging toilet/latrine; or bucket

**Table 15.8 Emptying and removal of waste from on-site sanitation facilities**

Percent distribution of de jure population in households with septic tanks and improved latrines by method of emptying and removal, and percentage of the population with on-site sanitation facilities for which excreta were safely disposed of in situ, percentage with on-site sanitation facilities for which excreta were disposed of unsafely, and percentage with on-site sanitation facilities for which excreta were removed for treatment, according to background characteristics, Tajikistan DHS 2023

| Background characteristic              | Percent distribution of method of emptying and disposal of waste from septic tanks or other on-site sanitation facilities |                                                 |                         |                                                                 |                                  |               |                            | Percentage of population with on-site sanitation facilities for which: |                                                      |                                                |                                                 | Number of persons with improved on-site sanitation facilities |

Note: On-site sanitation facilities are those where excreta are stored in a septic tank, pit latrine, or composting toilet.

<sup>1</sup> Includes septic tanks and latrines in which waste was buried in a covered pit, never emptied, and don't know if ever emptied

<sup>2</sup> Includes septic tanks and latrines in which waste was emptied to uncovered pits, open ground, water body, or other locations

<sup>3</sup> Includes septic tanks and latrines in which waste was removed by a service provider to a treatment plant or an unknown location or was removed by a non-service provider to an unknown location

**Table 15.9 Management of household excreta**

Percent distribution of de jure population by management of excreta from household sanitation facilities, according to background characteristics, Tajikistan DHS 2023

| Background characteristic | Connected to sewer | Using improved on-site sanitation facilities                        |                                                               |                                           | Using improved sanitation facilities, on-site status unknown | Using unimproved sanitation facilities | Practicing open defecation | Total | Percentage connected to sewer, with safe disposal on-site, or with removal for treatment off-site | Number of persons |
|---------------------------|--------------------|---------------------------------------------------------------------|---------------------------------------------------------------|-------------------------------------------|--------------------------------------------------------------|----------------------------------------|----------------------------|-------|---------------------------------------------------------------------------------------------------|-------------------|

Note: On-site sanitation facilities are those where excreta are stored in a septic tank, pit latrine, or composting toilet.

**Table 15.10 Disposal of children's stools**

Percent distribution of youngest children under age 2 living with their mother by the manner of disposal of the child's last fecal matter, and percentage of children whose stools are disposed of appropriately, according to background characteristics, Tajikistan DHS 2023

| Background characteristic                  | Manner of disposal of children's stools |                                   |        |                                |                     |       | Total | Percentage of children whose stools are disposed of appropriately <sup>1</sup> | Number of children |

Note: Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Children's stools are considered to be disposed of appropriately if the child used a toilet or latrine or if the fecal matter was put/rinsed into a toilet or latrine.

<sup>2</sup> See Table 15.6 for definition of categories.

**Table 15.11 Handwashing**

Percentage of the de jure population for whom the place most often used for washing hands was observed, by whether the location was fixed or mobile, and total percentage of the de jure population for whom the place for handwashing was observed; among the de jure population for whom the place for handwashing was observed, percentage with water available, percentage with soap available, and percentage with a cleansing agent other than soap available; percentage of the de jure population with a basic handwashing facility; and percentage with a limited handwashing facility, according to background characteristics, Tajikistan DHS 2023

| Background characteristic | Percentage of de jure population for whom place for washing hands was observed: |                                  |       | Number of persons | Place for handwashing observed and: |                             |                                                        | Number of persons for whom place for handwashing was observed | Percentage of de jure population with a basic handwashing facility <sup>3</sup> | Percentage of de jure population with a limited handwashing facility <sup>4</sup> | Number of persons for whom a place for handwashing was observed or with no place for handwashing in the dwelling, yard, or plot |

## A.1 INTRODUCTION

This section describes the objectives of the survey, the overall sample size, survey domains, and subsamples. The 2023 Tajikistan Demographic and Health Survey (2023 TjDHS) is the third DHS survey implemented in Tajikistan, following the 2012 and 2017 surveys. A nationally representative sample of 8,140 households was selected from 370 clusters. All women age 15–49 who were usual residents of the selected households or who slept in the households the night before the survey were eligible for interviews. The main objectives of the 2023 TjDHS were to provide up-to-date information on fertility and childhood mortality levels; fertility preferences; awareness, approval, and use of family planning methods; maternal and child health; knowledge of and attitudes toward HIV/AIDS and other sexually transmitted infections (STIs); and the health and nutritional status of women and their young children under age 5. In every household selected, all women age 15–49 and all children under age 5 were eligible for height and weight measurements and for anemia testing. One woman age 15–49 was randomly selected from each household for the domestic violence module and one child age 1–14 was randomly selected for the child discipline module. There was no male survey in the 2023 TjDHS.

There are five administrative regions in Tajikistan: Dushanbe City, Sughd, Khatlon, Districts of Republican Subordination (DRS), and Gorno-Badakhshan Autonomous Oblast (GBAO). The sample for the 2023 TjDHS was designed to produce representative results for the country as a whole, for urban and rural areas separately, and for each of the five administrative regions. Also, as in the previous TjDHS surveys, the sample was designed to allow certain indicators to be presented for the 12 districts in the Khatlon region covered under the Feed the Future program (FTF).

## A.2 SAMPLE FRAME

The sampling frame used for the 2023 TjDHS was the 2020 Tajikistan Population and Housing Census (TPHC), conducted by the Agency on Statistics under the President of the Republic of Tajikistan (Tajstat). As noted, Tajikistan is divided into five administrative regions; each region is subdivided into urban and rural areas, and there are 68 cities and rayons (districts) in total. Each city or rayon (district) is subdivided into census divisions, each census division into instruction areas, and each instruction area into enumeration areas (EAs).

The sampling frame for the 2023 TjDHS was a list of EAs covering all urban and rural areas of the country, with the primary sampling units (PSUs) being EAs in urban and rural areas. An EA is a geographical area, usually a city block, consisting of an adequate number of households; each EA served as a counting unit for the population census. The 2020 TPHC did not use EA maps. Urban EAs can be identified through a list of structures/households in the EA together with a description file. In rural areas, a PSU is a natural village if small or part of a large village. Rural PSUs can be identified with help from the village administration.

**Table A.1** shows the percent distribution of households by region and by type of residence. The table indicates that 32.6% of the households in Tajikistan are in urban areas. The size of the regions in Tajikistan varies substantially, with Khatlon and Sughd representing 32.0% and 31.2% of households, respectively, whereas GBAO represents only 2.3% of households. **Table A.2** presents the distribution of PSUs and their average size in number of households by region and by type of residence. There are in total 21,521 PSUs; among them, 3,612 are in urban areas and 17,909 are in rural areas. The average PSU size is 72 households; urban PSUs are larger (140 households on average) than rural PSUs (58 households on average).

**Table A.1 Households**

Distribution of residential households by region and residence, Tajikistan DHS 2023

| Region            | Residential households |                  |                  | Percentage urban | Percentage of households in the sampling frame |
|-------------------|------------------------|------------------|------------------|------------------|------------------------------------------------|
|                   | Urban                  | Rural            | Total            |                  |                                                |
| Dushanbe          | 184,456                |                  | 184,456          | 100.0            | 11.9                                           |

### A.3 SAMPLE DESIGN AND IMPLEMENTATION

The 2023 TjDHS sample was selected through a stratified two-stage cluster sampling procedure. Each region was stratified into urban and rural areas; since Dushanbe has no rural areas, there were a total of nine sampling strata. Samples were selected independently in each stratum in two stages. Implicit stratification and proportional allocation were achieved at each of the lower administrative levels by sorting the sampling frame within each sampling stratum before sample selection, according to administrative units at different levels, and by using probability proportional to size selection in the first stage of sampling.

In the first stage, 370 PSUs were selected with probability proportional to PSU size and with independent selection in each sampling stratum according to the sample allocation shown in **Table A.3**. PSU size was the number of residential households in the PSU based on the 2020 TPHC. After the selection of PSUs and before the main data collection, a household listing operation was carried out in all of the selected PSUs, and the resulting list of households served as the sampling frame for the selection of households in the second stage.

In the second stage, a fixed number of 22 households per PSU were selected with equal probability systematic selection from the newly updated household listing. The survey interviewers were asked to interview only the preselected households. No replacements and no changes of the preselected households were allowed in the implementation stages in order to prevent bias. When a PSU had less than 22 households listed, all of the households were included in the sample. All women age 15–49 who were usual members of the selected households or who spent the night before the survey in the selected households were eligible for the female survey.

**Table A.3** shows the sample allocation of clusters and households by region and residence. **Table A.4** shows the expected number of completed interviews according to region and residence. Based on a fixed sample take of 22 households per cluster, 370 PSUs were selected, 166 in urban areas and 204 in rural

areas. The total number of households selected was 8,140 (3,652 in urban areas and 4,488 in rural areas). The survey was expected to result in about 10,718 completed interviews with women age 15–49 (4,180 in urban areas and 6,538 in rural areas).

**Table A.3 Sample allocation of clusters and households**

Sample allocation of clusters and households by region, according to residence, Tajikistan DHS 2023

| Region            | Number of clusters allocated |            |            | Number of households allocated |              |              |
|-------------------|------------------------------|------------|------------|--------------------------------|--------------|--------------|
|                   | Urban                        | Rural      | Total      | Urban                          | Rural        | Total        |
| Dushanbe          | 75                           |            | 75         | 1,650                          |              | 1,650        |
| GBAO              | 9                            | 33         | 42         | 198                            | 726          | 924          |
| Sughd             | 29                           | 51         | 80         | 638                            | 1,122        | 1,760        |
| DRS               | 17                           | 62         | 79         | 374                            | 1,364        | 1,738        |
| Khatlon           | 36                           | 58         | 94         | 792                            | 1,276        | 2,068        |
| <b>Tajikistan</b> | <b>166</b>                   | <b>204</b> | <b>370</b> | <b>3,652</b>                   | <b>4,488</b> | <b>8,140</b> |

**Table A.4 Sample allocation of completed interviews with women**

Sample allocation of expected number of completed interviews with women by region, according to residence, Tajikistan DHS 2023

| Region            | Expected number of interviews with women age 15–49 |              |               |
|-------------------|----------------------------------------------------|--------------|---------------|
|                   | Urban                                              | Rural        | Total         |
| Dushanbe          | 1,888                                              |              | 1,888         |
| GBAO              | 227                                                | 1,057        | 1,284         |
| Sughd             | 730                                                | 1,635        | 2,365         |
| DRS               | 428                                                | 1,987        | 2,415         |
| Khatlon           | 907                                                | 1,859        | 2,766         |
| <b>Tajikistan</b> | <b>4,180</b>                                       | <b>6,538</b> | <b>10,718</b> |

The sample calculations were based on the results of the 2017 TjDHS: the average number of women age 15–49 per household was 1.2 in urban areas and 1.5 in rural areas, the household completion rate was 96% in urban areas and 98% in rural areas, and the response rate among women was 99% in both urban and rural areas.

## A.4 SAMPLE PROBABILITIES AND SAMPLING WEIGHTS

Due to the nonproportional allocation of the sample to different regions and to their urban and rural areas and the possible differences in response rates, sampling weights will be required for any analysis using the 2023 TjDHS data to ensure the actual representativeness of the survey results at the national level as well as the domain level. Since the 2023 TjDHS sample was a two-stage stratified cluster sample, sampling weights were calculated based on sampling probabilities separately for each sampling stage and for each cluster. The following notations were used:

$P_{1hi}$ : first-stage sampling probability of the  $i^{\text{th}}$  cluster in stratum  $h$

$P_{2hi}$ : second-stage sampling probability within the  $i^{\text{th}}$  cluster (households)

$P_{hi}$ : overall sampling probability of any households in the  $i^{\text{th}}$  cluster in stratum  $h$

Let  $n_h$  be the number of clusters selected in stratum  $h$ ,  $M_{hi}$  the number of households in the  $i^{\text{th}}$  cluster according to the sampling frame, and  $\sum_i M_{hi}$  the total number of households in stratum  $h$ . The first stage's probability of selecting the  $i^{\text{th}}$  cluster in stratum  $h$  is calculated as follows:

$$P_{1hi} = \frac{n_h M_{hi}}{\sum_i M_{hi}}$$

Let  $L_{hi}$  be the number of households listed in the household listing operation in cluster  $i$  in stratum  $h$ , and let  $s_{hi}$  be the number of households selected in the cluster. The second stage's selection probability for each household in the cluster is calculated as follows:

$$P_{2hi} = \frac{s_{hi}}{L_{hi}}$$

The overall selection probability of each household in cluster  $i$  of stratum  $h$  is therefore the product of the two-stage selection probabilities:

$$P_{hi} = P_{1hi} \times P_{2hi}$$

The design weight for each household in cluster  $i$  of stratum  $h$  is the inverse of its overall selection probability:

$$W_{hi} = 1/P_{hi}$$

A spreadsheet containing all sampling parameters and selection probabilities was prepared to help calculate the design weights. Design weights were adjusted for household nonresponse and individual nonresponse to obtain the sampling weights for households and for women. Nonresponse was adjusted at the sampling stratum level. For household sampling weights, household design weights were multiplied by the inverse of household response rates according to stratum. For women's individual sampling weights, household sampling weights were multiplied by the inverse of women's individual response rates according to stratum. After adjustment for nonresponse, the sampling weights were normalized (by multiplying the sampling weight by the estimated total sampling fraction obtained from the survey for the household weight and the woman's weight) to obtain the final standard weights that appear in the data files. The normalization process was done so that the total number of unweighted cases was equal to the total number of weighted cases at the national level for both households and women. The normalized weights are relative weights that are valid for estimating means, proportions, ratios, and rates but are not valid for estimations based on pooled data or for estimating population totals.

## A.5 SURVEY RESULTS

**Table A.5** presents interview response rates in the 2023 TjDHS by urban and rural residence and region.

**Table A.5 Sample implementation**

Percent distribution of households and eligible women age 15–49 by results of the household and individual interviews, and household, eligible women, and overall women response rates, according to residence and region (unweighted), Tajikistan DHS 2023

<sup>1</sup> Using the number of households falling into specific response categories, the household response rate (HRR) is calculated as:

$$\frac{100 * C}{C + HP + P + R + DNF}$$

<sup>2</sup> The eligible women response rate (EWRR) is equivalent to the percentage of interviews completed (EWC).

<sup>3</sup> The overall women response rate (OWRR) is calculated as:

$$OWRR = HRR * EWRR/100$$

The estimates from a sample survey are affected by two types of errors: nonsampling errors and sampling errors. Nonsampling errors are the results of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the 2023 Tajikistan Demographic and Health Survey (2023 TjDHS) to minimize this type of error, nonsampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in the 2023 TjDHS is only one of many samples that could have been selected from the same population, using the same design and sample size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability among all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

Sampling error is usually measured in terms of the *standard error* for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95% of all possible samples of identical size and design.

If the sample of respondents had been selected by simple random sampling, it would have been possible to use straightforward formulas for calculating sampling errors. However, the 2023 TjDHS sample was the result of a multistage stratified cluster design, and, consequently, it was necessary to use more complex formulas. Sampling errors are computed in SAS programs developed by ICF. These programs use the Taylor linearization method to estimate variances for survey estimates that are means, proportions, or ratios. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as fertility and mortality rates.

The Taylor linearization method treats any linear statistic such as a percentage or mean as a ratio estimate,  $r = y/x$ , where  $y$  represents the total sample value for variable  $y$  and  $x$  represents the total number of cases in the group or subgroup under consideration. The variance of  $r$  is computed using the formula given below, with the standard error being the square root of the variance:

$$SE^2(r) = var(r) = \frac{1-f}{x^2} \sum_{h=1}^H \left[ \frac{m_h}{m_h-1} \left( \sum_{i=1}^{m_h} z_{hi}^2 - \frac{z_h^2}{m_h} \right) \right]$$

in which

$$z_{hi} = y_{hi} - rx_{hi} \text{ and } z_h = y_h - rx_h$$

where  $h$  represents the stratum, which varies from 1 to  $H$ ;  
 $m_h$  is the total number of clusters selected in the  $h^{\text{th}}$  stratum;  
 $y_{hi}$  is the sum of the weighted values of variable  $y$  in the  $i^{\text{th}}$  cluster in the  $h^{\text{th}}$  stratum;  
 $x_{hi}$  is the sum of the weighted number of cases in the  $i^{\text{th}}$  cluster in the  $h^{\text{th}}$  stratum; and  
 $f$  is the overall sampling fraction, which is so small that it is ignored.

The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample and calculates standard errors for these estimates using simple formulas. Each replication considers *all but one* cluster in the calculation of the estimates. Pseudo-independent replications are thus created. In the 2023 TjDHS, there were 370 non-empty clusters. Hence, 370 replications were created. The variance of a rate  $r$  is calculated as follows:

$$SE^2(r) = var(r) = \frac{1}{k(k-1)} \sum_{i=1}^k (r_i - r)^2$$

in which

$$r_i = kr - (k-1)r_{(i)}$$

where  $r$  is the estimate computed from the full sample of 370 clusters,  
 $r_{(i)}$  is the estimate computed from the reduced sample of 369 clusters ( $i^{\text{th}}$  cluster excluded),  
and  
 $k$  is the total number of clusters.

In addition to the standard error, the design effect (DEFT) for each estimate is calculated. The design effect is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. Relative standard errors and confidence limits for the estimates are also calculated.

Sampling errors for the 2023 TjDHS are calculated for selected variables considered to be of primary interest. The results are presented in this appendix for the country as a whole, for urban and rural areas separately, for each of the five regions, and for the Feed the Future (FTF) program areas. For each variable, the type of statistic (mean, proportion, or rate) and the base population are given in **Table B.1**. **Tables B.2** through **B.10** present the value of the statistic ( $R$ ), its standard error ( $SE$ ), the number of unweighted( $N$ ) and weighted( $WN$ ) cases, the design effect (DEFT), the relative standard error ( $SE/R$ ), and the 95% confidence limits ( $R \pm 2SE$ ) for each variable. The sampling errors for mortality rates are presented for the 5-year period preceding the survey for the national sample and the urban and rural samples and for the 10-year period preceding the survey at other domain levels. The DEFT is considered undefined when the standard error considering a simple random sample is zero (when the estimate is close to 0 or 1).

The confidence interval (e.g., as calculated for *mean number of children ever born to women age 15–49*) can be interpreted as follows: the overall average from the national sample is 2.115, and its standard error is 0.020. Therefore, to obtain the 95% confidence limits, one adds and subtracts twice the standard error to the sample estimate, that is,  $2.115 \pm 2 \times 0.020$ . There is a high probability (95%) that the *true* mean number of children ever born to women age 15–49 is between 2.076 and 2.154.

For the total sample, the value of the DEFT, averaged over all variables, is 1.51. This means that, due to multistage clustering of the sample, the average standard error is increased by a factor of 1.51 over that in an equivalent simple random sample.

**Table B.1 List of selected variables for sampling errors, Tajikistan DHS 2023**

| Variable                                                         | Estimate   | Base population                                                                                               |
|------------------------------------------------------------------|------------|---------------------------------------------------------------------------------------------------------------|
| HOUSEHOLDS AND POPULATION                                        |            |                                                                                                               |
| Electricity primary source of lighting                           | Proportion | De jure household population                                                                                  |
| Primary reliance on clean fuels and technology                   | Proportion | De jure household population                                                                                  |
| Births registered with civil authority                           | Proportion | De jure household population under 5                                                                          |
| Improved drinking water source                                   | Proportion | De jure household population                                                                                  |
| At least basic drinking water service                            | Proportion | De jure household population                                                                                  |
| Water available when needed                                      | Proportion | De jure household population                                                                                  |
| Improved sanitation facility                                     | Proportion | De jure household population                                                                                  |
| At least basic sanitation service                                | Proportion | De jure household population                                                                                  |
| Using open defecation                                            | Proportion | De jure household population                                                                                  |
| Using a handwashing facility with soap and water                 | Proportion | De jure household population for whom handwashing place was observed or with no on-site place for handwashing |
| WOMEN                                                            |            |                                                                                                               |

| Currently married/in union                                       | Proportion | Women 15–49                                                                                                   |
| Married before age 15                                            | Proportion | Women 25–49                                                                                                   |
| Married before age 18                                            | Proportion | Women 25–49                                                                                                   |
| Had sexual intercourse before age 18                             | Proportion | Women 20–49                                                                                                   |
| Age-specific fertility rate 15–19                                | Rate       | Woman-years of exposure to childbearing at age 15–19 in the 3 years preceding the survey                      |
| Total fertility rate (3 years)                                   | Rate       | Woman-years of exposure to childbearing                                                                       |
| Total abortion rate (3 years)                                    | Rate       | Woman-years of exposure to childbearing                                                                       |
| Currently pregnant                                               | Proportion | Women 15–49                                                                                                   |
| Mean number of children ever born to women age 40–49             | Mean       | Women 40–49                                                                                                   |
| Mean number of children ever born to women age 15–49             | Mean       | Women 15–49                                                                                                   |
| Mean number of living children among women age 15–49             | Mean       | Women 15–49                                                                                                   |
| Median birth interval                                            | Median     | Non-first births in the 5 years preceding the survey                                                          |
| First birth before age 18                                        | Proportion | Women 20–49                                                                                                   |
| Want to delay next birth at least 2 years                        | Proportion | Currently married women 15–49                                                                                 |
| Want no more children                                            | Proportion | Currently married women 15–49                                                                                 |
| Ideal number of children                                         | Mean       | Women 15–49 with numeric responses                                                                            |
| Total wanted fertility rate (3 years)                            | Rate       | Woman-years of exposure to childbearing                                                                       |
| Currently using any contraceptive method                         | Proportion | Currently married women 15–49                                                                                 |
| Currently using any modern method                                | Proportion | Currently married women 15–49                                                                                 |
| Currently using pill                                             | Proportion | Currently married women 15–49                                                                                 |
| Currently using injectables                                      | Proportion | Currently married women 15–49                                                                                 |
| Currently using male condom                                      | Proportion | Currently married women 15–49                                                                                 |
| Currently using any traditional method                           | Proportion | Currently married women 15–49                                                                                 |
| 12-month discontinuation rate due to method failure              | Rate       | Women 15–49                                                                                                   |
| 12-month discontinuation rate due to any reason                  | Rate       | Women 15–49                                                                                                   |
| 12-month discontinuation rate due to switching to another method | Rate       | Women 15–49                                                                                                   |
| Unmet need for spacing                                           | Proportion | Currently married women 15–49                                                                                 |
| Unmet need for limiting                                          | Proportion | Currently married women 15–49                                                                                 |
| Unmet need total                                                 | Proportion | Currently married women 15–49                                                                                 |
| Demand satisfied by modern methods (married women)               | Proportion | Currently married women 15–49                                                                                 |
| Demand satisfied by modern methods (all women)                   | Proportion | Women 15–49                                                                                                   |
| Participation in decision making about family planning           | Proportion | Currently married women 15–49                                                                                 |
| Not exposed to any of the eight media sources                    | Proportion | Women 15–49                                                                                                   |
| Neonatal mortality rate <sup>1</sup>                             | Rate       | Children exposed to the risk of mortality                                                                     |
| Postneonatal mortality rate <sup>1</sup>                         | Rate       | Children exposed to the risk of mortality                                                                     |
| Infant mortality rate <sup>1</sup>                               | Rate       | Children exposed to the risk of mortality                                                                     |
| Child mortality rate <sup>1</sup>                                | Rate       | Children exposed to the risk of mortality                                                                     |
| Under-5 mortality rate <sup>1</sup>                              | Rate       | Children exposed to the risk of mortality                                                                     |
| Perinatal mortality rate                                         | Rate       | Pregnancies of 28 or more weeks' duration among women 15–49 in the 5 years preceding the survey               |
| Stillbirth rate                                                  | Rate       | Pregnancies of 28 or more weeks' duration among women 15–49 in the 5 years preceding the survey               |
| Early neonatal mortality rate                                    | Rate       | Pregnancies of 28 or more weeks' duration among women 15–49 in the 5 years preceding the survey               |
| In any avoidable high-risk category                              | Proportion | Children born in the 5 years preceding the survey to women 15–49                                              |
| Received ANC from a skilled provider                             | Proportion | Women 15–49 who had a live birth in the 2 years preceding the survey                                          |
| 4+ ANC visits                                                    | Proportion | Women 15–49 who had a live birth in the 2 years preceding the survey                                          |
| 8+ ANC visits                                                    | Proportion | Women 15–49 who had a live birth in the 2 years preceding the survey                                          |
| Took any iron-containing supplements                             | Proportion | Women 15–49 who had a live birth in the 2 years preceding the survey                                          |
| Delivered in a health facility (live births)                     | Proportion | Live births in the 2 years preceding the survey                                                               |
| Delivered by C-section (live births)                             | Proportion | Live births in the 2 years preceding the survey                                                               |
| Delivered by a skilled provider (live births)                    | Proportion | Live births in the 2 years preceding the survey                                                               |
| Women with postnatal check during first 2 days                   | Proportion | Women 15–49 with a live birth in the 2 years preceding the survey                                             |
| Newborns with postnatal check during first 2 days                | Proportion | Most recent live births in the 2 years preceding the survey                                                   |
| Any problem accessing health care                                | Proportion | Women 15–49                                                                                                   |

**Table B.1—Continued**

| Variable                                                                                                  | Estimate   | Base population                                                      |
|-----------------------------------------------------------------------------------------------------------|------------|----------------------------------------------------------------------|
| Received BCG vaccination                                                                                  | Proportion | Children 12–23 months                                                |
| Received DPT-HepB-Hib vaccination (3 doses)                                                               | Proportion | Children 12–23 months                                                |
| Received pneumococcal vaccination (2 doses)                                                               | Proportion | Children 12–23 months                                                |
| Received 12 vaccinations according to national schedule (12–23 months)                                    | Proportion | Children 12–23 months                                                |
| Received MR/MMR-1 vaccination (24–35 months)                                                              | Proportion | Children 24–35 months                                                |
| Received all basic vaccinations (24–35 months)                                                            | Proportion | Children 24–35 months                                                |
| Received 15 vaccinations according to national schedule (24–35 months)                                    | Proportion | Children 24–35 months                                                |
| Sought treatment for diarrhea                                                                             | Proportion | Children under 5 with diarrhea in last 2 weeks                       |
| Treated with ORS                                                                                          | Proportion | Children under 5 with diarrhea in last 2 weeks                       |
| Height-for-age (–3 SD)                                                                                    | Proportion | Children under 5 who were measured                                   |
| Height-for-age (–2 SD)                                                                                    | Proportion | Children under 5 who were measured                                   |
| Weight-for-height (–2 SD)                                                                                 | Proportion | Children under 5 who were measured                                   |
| Weight-for-height (+2 SD)                                                                                 | Proportion | Children under 5 who were measured                                   |
| Weight-for-age (–2 SD)                                                                                    | Proportion | Children under 5 who were measured                                   |
| Exclusive breastfeeding                                                                                   | Proportion | Youngest children 0–5 months living with their mother                |
| Minimum dietary diversity (children 6–23 months)                                                          | Proportion | Youngest children 6–23 months living with their mother               |
| Prevalence of anemia (children 6–59 months) (hemoglobin <11.0 g/dl)                                       | Proportion | Children 6–59 months who were tested                                 |
| Body mass index (BMI) <18.5                                                                               | Proportion | Women 20–49 who were measured                                        |
| Body mass index (BMI) ≥25                                                                                 | Proportion | Women 20–49 who were measured                                        |
| Body mass index-for-age (–2 SD)                                                                           | Proportion | Adolescent women 15–19 who were measured                             |
| Body mass index-for-age (+1 SD)                                                                           | Proportion | Adolescent women 15–19 who were measured                             |
| Minimum dietary diversity (women 15–49)                                                                   | Proportion | Women 15–49                                                          |
| Prevalence of any anemia (women 15–49)                                                                    | Proportion | Women 15–49 who were tested                                          |
| Prevalence of any anemia (nonpregnant women 15–49) (hemoglobin <12.0 g/dl)                                | Proportion | Nonpregnant women 15–49 who were tested                              |
| Prevalence of any anemia (pregnant women 15–49) (hemoglobin <11.0 g/dl)                                   | Proportion | Pregnant women 15–49 who were tested                                 |
| Child had fever in last 2 weeks                                                                           | Proportion | Child under 5                                                        |
| Child had blood taken from finger/heel                                                                    | Proportion | Child under 5 who had fever in the last 2 weeks                      |
| Discriminatory attitudes towards people with HIV                                                          | Proportion | Women 15–49 who have heard of HIV/AIDS                               |
| Condom use at last sex                                                                                    | Proportion | Women 15–49 with nonmarital, noncohabiting partner in last 12 months |
| Ever tested for HIV and received results of last test                                                     | Proportion | Women 15–49                                                          |
| Employed in last 12 months                                                                                | Proportion | Currently married women 15–49                                        |
| Employed in last 12 months but not paid                                                                   | Proportion | Currently married women 15–49 employed in last 12 months             |
| Mobile phone ownership                                                                                    | Proportion | Women 15–49                                                          |
| Have and use a bank account or mobile phone for financial transactions                                    | Proportion | Women 15–49                                                          |
| Participate in decision making (all three decisions)                                                      | Proportion | Currently married women 15–49                                        |
| Agree with at least one specified reason a husband is justified in wife beating                           | Proportion | Women 15–49                                                          |
| Make own decisions about sexual relations, contraceptive use, and reproductive care                       | Proportion | Currently married women 15–49                                        |
| Experienced physical violence since age 15 by any perpetrator                                             | Proportion | All women 15–49                                                      |
| Experienced sexual violence by any perpetrator ever                                                       | Proportion | All women 15–49                                                      |
| Experienced sexual violence by any non-intimate partner                                                   | Proportion | All women 15–49                                                      |
| Experienced physical/sexual/emotional violence by any husband or intimate partner ever                    | Proportion | Ever-married women 15–49                                             |
| Experienced physical/sexual/emotional violence by current or most recent husband or intimate partner ever | Proportion | Ever-married women 15–49                                             |
| Experienced physical/sexual violence by current or most recent husband or intimate partner ever           | Proportion | Ever-married women 15–49                                             |
| Experienced physical/sexual/emotional violence by any husband or intimate partner in the last 12 months   | Proportion | Ever-married women 15–49                                             |

<sup>1</sup> Mortality rates are calculated for the 5 years before the survey for the national, urban, and rural samples and for the 10 years before the survey for the regional samples.

**Table B.2 Sampling errors: Total sample, Tajikistan DHS 2023**

| Variable                                                         | Value<br>(R) | Standard<br>error<br>(SE) | Number of cases   |                  | Design<br>effect<br>(DEFT) | Relative<br>error<br>(SE/R) | Confidence limits |                  |
|------------------------------------------------------------------|--------------|---------------------------|-------------------|------------------|----------------------------|-----------------------------|-------------------|------------------|
|                                                                  |              |                           | Unweighted<br>(N) | Weighted<br>(WN) |                            |                             | Lower<br>(R-2SE)  | Upper<br>(R+2SE) |

<sup>1</sup> Ten children were measured twice for each of the four standardization/restandardization exercises.

<sup>2</sup> Trainees' precision and accuracy are defined in terms of a technical error of measurement (TEM), which is calculated as  $\sqrt{\sum(D^2)/(2N)}$ , where D is the difference in height and N is the number of repeat measurements. An acceptable TEM according to WHO-UNICEF is a TEM of <0.6 cm for precision and <0.8 cm for accuracy.

**Table C.8 Height and weight data completeness and quality for children**

Among children under age 5 who were eligible for anthropometry, percentage with incomplete or missing data for height and weight; among children with complete data on height and age, percentage with implausible data for height-for-age; among children with complete data on weight and height, percentage with implausible data for weight-for-height; among children with complete data on weight and age, percentage with implausible data for weight-for-age; and among all children under age 5 who were eligible for anthropometry, percentage with valid data for height-for-age, weight-for-height, and weight-for-age, according to background characteristics (unweighted), Tajikistan DHS 2023

<sup>1</sup> Child's height in centimeters is missing, child was not present, measurement of child was refused, and "other" result codes

<sup>2</sup> Child's weight in kilograms is missing, child was not present, measurement of child was refused, and "other" result codes

<sup>3</sup> Implausible cases for height-for-age are defined as more than 6 standard deviations (SD) above or below the standard population median (z scores) based on the WHO Child Growth Standards among children with complete height and month/year of birth data.

<sup>4</sup> Complete age is calculated from month and year of birth.

<sup>5</sup> Implausible cases for weight-for-height are defined as more than 5 SD above or below the standard population median (z scores) based on the WHO Child Growth Standards among children with complete weight and height data.

<sup>6</sup> Implausible cases for weight-for-age are defined as more than 5 SD above or 6 SD below the standard population median (z scores) based on the WHO Child Growth Standards among children with complete weight and month/year of birth data.

<sup>7</sup> No missing data, incomplete data, or implausible data

<sup>8</sup> Includes children whose mothers are deceased

<sup>9</sup> For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the Household Questionnaire

**Table C.9 Height measurements from random subsample of measured children**

Differences in first height measurement and second height measurement among children under age 5 randomly selected and remeasured, according to region and measurer (unweighted), Tajikistan DHS 2023

| Region and measurer  | Median difference in height measurements <sup>1</sup> | Percentage of height measurements with a difference >1 cm | Number of children randomly selected and remeasured |
|----------------------|-------------------------------------------------------|-----------------------------------------------------------|-----------------------------------------------------|
| <b>Region</b>        |                                                       |                                                           |                                                     |

Note: An asterisk indicates that a figure is based on fewer than 10 children, which is the minimum number of children needed to calculate the technical error of measurement.

<sup>1</sup> Median absolute difference between measurers' first and second height measurements in centimeters

**Table C.10 Interference in height and weight measurements of children**

Among children under age 5 measured for height or weight, percentage for whom hairstyle or ornamentation interfered with height measurement and percentage who were not minimally dressed or who wore heavy permanent ornaments during weight measurement, according to background characteristics (unweighted), Tajikistan DHS 2023

| Background characteristic | Percentage of children for whom hairstyle or ornamentation interfered with height measurement | Percentage of children who were not minimally dressed or who wore heavy permanent ornaments during weight measurement | Number of children |

**Table C.12 Heaping in anthropometric measurements for children (digit preference)**

Distribution of weight and height/length measurements by decimal digit recorded (unweighted), Tajikistan DHS 2023

| Digit                               | Weight |         | Height or length |         |
|-------------------------------------|--------|---------|------------------|---------|
|                                     | Number | Percent | Number           | Percent |
| 0                                   | 479    | 9.6     | 457              | 9.1     |
| 1                                   | 568    | 11.3    | 464              | 9.3     |
| 2                                   | 549    | 11.0    | 667              | 13.3    |
| 3                                   | 507    | 10.1    | 630              | 12.6    |
| 4                                   | 539    | 10.8    | 620              | 12.4    |
| 5                                   | 583    | 11.6    | 606              | 12.1    |
| 6                                   | 436    | 8.7     | 490              | 9.8     |
| 7                                   | 401    | 8.0     | 431              | 8.6     |
| 8                                   | 497    | 9.9     | 378              | 7.5     |
| 9                                   | 452    | 9.0     | 268              | 5.3     |
| Total                               | 5,011  | 100.0   | 5,011            | 100.0   |
| Index of dissimilarity <sup>1</sup> | na     | 4.8     | na               | 10.3    |

Note: Table includes all children with weight and height/length measurements, regardless of the completeness of date of birth information and cases with implausible data. Both weight and length/height measurements were recorded with one decimal digit.

na = not applicable

<sup>1</sup> The index of dissimilarity is a measure of digit preference calculated as one-half of the sum of absolute differences between the observed and expected percentage. It can be interpreted as the percentage of values that would need to be redistributed in order to achieve a uniform distribution.

**Table C.13 Observation of handwashing facility**

Percent distribution of handwashing facilities in all households by whether or not they were observed by the interviewers, according to background characteristics (weighted), Tajikistan DHS 2023

| Background characteristic | Handwashing facility observed |        | Handwashing facility not observed |                      |              | Total | Number of households |
|---------------------------|-------------------------------|--------|-----------------------------------|----------------------|--------------|-------|----------------------|
|                           | Fixed place                   | Mobile | Not in dwelling, yard, or plot    | No permission to see | Other reason |       |                      |

Note: Age at the beginning of the school year is calculated from dates of birth of household members or by rejuvenating household members based on the date of the survey, the date after the start of the school year, and completed age at the time of the survey. Levels and grades refer to the current school year or the most recent school year if data collection was completed between school years.

<sup>a</sup> Those age 25 at the time of the interview who were age 24 at the beginning of the school year are excluded from the table since data on current attendance were collected only for those age 4–24 at the time of the interview.

**Table C.15 Vaccination cards photographed**

Percentage of children under age 3 reported to have a vaccination card kept at a health facility or a home-based vaccination passport, percentage whose vaccination card was seen by the interviewer, percentage whose vaccination card was photographed or was not photographed by reason, and among children with a vaccination card seen, percentage of cards photographed, according to background characteristics (weighted) Tajikistan DHS 2023

| Background characteristic | Percentage of children reported to have a vaccination card | Percentage of children whose vaccination card was seen by interviewer | Percentage of children whose vaccination card was photographed | Percentage of children whose vaccination card was not photographed as permission was not received | Percentage of children whose vaccination card was not photographed for other reasons | Number of children | Among children with a vaccination card seen  |                    |

Note: Table is based on children who stayed in the household on the night before the interview and who were tested for anemia. Prevalence of anemia, based on hemoglobin levels, is adjusted for altitude using formulas in CDC 1998 and cutoffs defined in WHO 2011c. Hemoglobin is measured in grams per deciliter (g/dl) using the HemoCue 201+ device. Figures in parentheses are based on 25–49 unweighted cases.

<sup>1</sup> Includes children whose mothers are deceased

<sup>2</sup> For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the Household Questionnaire.

**Table C.17 Prevalence of anemia in women based on 2011 WHO guidelines**

Percentage of women age 15–49 classified as having anemia, according to background characteristics, Tajikistan DHS 2023

| Background characteristic           | Anemia status by hemoglobin level       |                                                  |                                                   |                                            | Number of women |

Note: Prevalence of anemia, based on hemoglobin levels, is adjusted for altitude and for cigarette smoking, if known, using formulas in CDC 1998 and cutoffs defined in WHO 2017b. Hemoglobin is measured in grams per deciliter (g/dl) using the HemoCue 201+ device.

NP = nonpregnant

P = pregnant

<sup>1</sup> Includes women who do not know if they are pregnant

# PERSONS INVOLVED IN THE 2023 TAJIKISTAN DEMOGRAPHIC AND HEALTH SURVEY

## Appendix D

### NATIONAL COORDINATOR

**Nurmahmadzoda Jamshed**, Director, Agency on Statistics under the President of the Republic of Tajikistan

### DEPUTY NATIONAL COORDINATOR FOR MEDICAL AFFAIRS

**Muhsinzoda Gafur Mukhsin**, First Deputy Minister of Health and Social Protection of the Population of the Republic of Tajikistan

### DEPUTY NATIONAL COORDINATOR FOR FIELD IMPLEMENTATION

**Aso Nurullo Asvat**, First Deputy Director, Agency on Statistics under the President of the Republic of Tajikistan

### AGENCY ON STATISTICS UNDER THE PRESIDENT OF THE REPUBLIC OF TAJIKISTAN

**Nabizoda Abduvali**, 2023 Tajikistan DHS Technical Director  
**Azizzoda Ilhom**, 2023 Tajikistan DHS Deputy Technical Director  
**Tashrifzoda Qiyomuddin**, Secretary/Assistant  
**Nemonov Mahmadi**, Administrative and Legal Support  
**Qamarzoda Hukmiddin**, Administrative Support  
**Safarbek Khabibullozoda**, Financial Support  
**Furkat Mirpochchoev**, Chief Programmer/Data Entry Coordinator  
**Rustamov Ravshan**, IT and CAPI Specialist  
**Hamza Majidov**, IT and CAPI Specialist  
**Yusuf Siddikov**, IT and CAPI Specialist  
**Akhror Zokirov**, IT and CAPI Specialist  
**Aziz Makhmadulloev**, IT and CAPI Specialist  
**Nachibullo Nazarov**, IT and CAPI Specialist  
**Abdufattoh Emomaliev**, Technical Editor  
**Zainullo Aliyev**, Technical Editor

### MINISTRY OF HEALTH AND SOCIAL PROTECTION OF THE POPULATION

**Zulfiya Abdusamatzoda**, Deputy Minister  
**Abdukholiq Amirzoda**, Deputy Minister  
**Zohir Nabiev**, Head of the Department of Organization of Medical Services for Mothers, Children and Family Planning  
**Navruz Jafarov**, Head of the Department of Sanitary and Epidemiological Safety, Emergencies and Emergency Medical Care  
**Dilorom Yunusova**, Head, Division of Safe Motherhood and Family Planning  
**Gulrukhsor Safarova**, Director, Republican Center for Medical Statistics and Information  
**Hafiza Saidova**, Director, National Center for Reproductive Health  
**Inom Haqnazarov**, Director, Republican Nutrition Center  
**Mohtob Bobokhonova**, Deputy Director, Republican Center for Immunoprophylaxis  
**Furqat Mahmudov**, Deputy Director, Republican Center for Medical Statistics and Information  
**Alijon Soliev**, Deputy Director, Republican Center for the Prevention and Control of AIDS

## FIELDWORK IMPLEMENTATION

### Regional Coordinators

Juraboyzoda Zebo  
Bobobekova Ruzigul  
Ganieva Firuza  
Shamsieva Qumriniso  
Makhmadrasulova Sadbarg

### Quality Control Teams

Shoeva Zubigul  
Giesova Shahlo  
Aliboeva Hasyat  
Furqat Mahmudov  
Firuz Mavlonov  
Josiba Abdulloeva

### Team Supervisors

Gulomdzhonova Zarina  
Kosimova Muhayo  
Mazbutova Zarrina  
Chalisheva Firuza  
Sharipova Muqaddas  
Fayozova Rohat  
Muydinzoda Dilorom  
Gulchonova Latifa

Elbonova Usnigul  
Nurbekova Nargis  
Davlatova Nigina  
Alimova Shahlo  
Rajabova Holdon  
Shoimardonova Kholniso  
Qodirova Muqaddas

### Health Investigators

Kurbonov Daler  
Kuvvatova Sadafmikh  
Aliev Shodmon  
Rachabzoda Rukhshona  
Kurbonov Safar  
Zokirova Alcos  
Sherova Shohida  
Kosimov Yusuf  
Akilova Mohira  
Abdulloev Rakhmatullo  
Safarov Abdullo  
Abdusamadova Shahnoza  
Mustafoeva Shoir  
Pulotova Nodirahon  
Zamonshoeva Sitora

Jangieva Sabza  
Shozieva Nuriniso  
Ziyofatzoda Malvina  
Toshhuchaeva Parvina  
Munavvarova Gulchehra  
Nurov Jamshed  
Barotova Nazira  
Fayozova Bunafsha  
Sunatulloi Yusuf  
Ramazonova Sojida  
Sidikova Farzona  
Saidova Gavhar  
Jumaeva Zebo  
Azorabekova Maiguna  
Boeva Gulchehra

### Interviewers

Bakhrudinova Bakhora  
Azizzoda Farzona  
Asadulloeva Farzona  
Nizomova Dilbar  
Sidikova Fotima  
Safarova Manizha  
Teshaeve Surayyo  
Dustova Nargis  
Sharipova Matluba  
Kurbonnazarova Sarvinosis  
Rajabova Marchona  
Hikmatova Mehrangez  
Muqaddasi Latifi  
Rakhimova Marvorid  
Abdulloeva Zebo  
Abdulloeva Sayyora  
Gaforova Zarrina  
Dadojonova Gulnora  
Ismatova Mehrona  
Kurbonova Zarrina

Komilova Gulchehra  
Mirrachabova Farzona  
Shodieva Fasolate  
Machidova Dilbar  
Tolibzoda Volida  
Majidova Maftuna  
Zokirova Ozoda  
Alifova Rahima  
Vafodorova Malika  
Gazalova Nigina  
Mavlonazarova Dilor  
Muborakshoeva Nozigul  
Murodalieva Mahingul  
Oshurbekova Shakhlo  
Shonkulieva Farzona  
Nurova Marhabo  
Davlatbekova Manizha  
Davlatzoda Mohliko  
Rahimova Zulaiho  
Azimova Malik

Nurmakhmadova Nargis  
Zokirova Sayohat  
Sharipova Shahnoza  
Sangova Mairam  
Faizmakhamdova Safina  
Tillozoda Bibirajab  
Gulova Anvarbi  
Kholova Nilufar  
Ismatova Ulfatniso  
Ranoguli Emomali  
Saimakhmadova Yagona  
Rakhmonov Rukhsora  
Qahorova Mavzuna  
Mazarieva Zulfiya  
Rasulova Dilbar  
Rustamova Gavhar

## INTRODUCTION AND CONSENT

Hello. My name is \_\_\_\_\_. I am working with Agency on Statistics under the President of the Republic of Tajikistan. We are conducting a survey about health and other topics all over Tajikistan. The information we collect will help the government to plan health services. Your household was selected for the survey. I would like to ask you some questions about your household. The questions usually take about 15 to 20 minutes. All of the answers you give will be confidential and will not be shared with anyone other than members of our survey team. You don't have to be in the survey, but we hope you will agree to answer the questions since your views are important. If I ask you any question you don't want to answer, just let me know and I will go on to the next question or you can stop the interview at any time. In case you need more information about the survey, you may contact the person listed on this card.

GIVE CARD WITH CONTACT INFORMATION

Do you have any questions?

May I begin the interview now?

                                                                                           |

SELECTION OF ONE CHILD FOR CHILD DISCIPLINE

- 38 LOOK AT THE LAST DIGIT OF THE HOUSEHOLD NUMBER ON THE COVER PAGE. THIS IS THE ROW NUMBER YOU SHOULD GO TO. CHECK THE TOTAL NUMBER OF ELIGIBLE CHILDREN **31** ON THE PREVIOUS PAGE. THIS IS THE COLUMN NUMBER YOU SHOULD GO TO. FOLLOW THE SELECTED ROW AND COLUMN TO THE CELL WHERE THEY MEET AND CIRCLE THE NUMBER IN THE CELL. THIS IS THE RANK NUMBER OF THE CHILD SELECTED FOR THE CHILD LABOUR/CHILD DISCIPLINE QUESTIONS FROM THE BOX OF ELIGIBLE CHILDREN IN **SL3**. WRITE THE NAME, LINE NUMBER, AND RANK NUMBER OF THE SELECTED CHILD IN THE SPACE BELOW THE TABLE.

EXAMPLE: THE HOUSEHOLD NUMBER IS '716' AND **31** SHOWS THAT THERE ARE THREE ELIGIBLE CHILDREN AGE 1-14 IN THE HOUSEHOLD. SINCE THE LAST DIGIT OF THE HOUSEHOLD NUMBER IS '6' GO TO ROW '6' AND SINCE THERE ARE THREE ELIGIBLE CHILDREN IN THE HOUSEHOLD, GO TO COLUMN '3'. FOLLOW THE ROW AND COLUMN AND FIND THE NUMBER IN THE CELL WHERE THEY MEET ('2') AND CIRCLE THE NUMBER. NOW GO TO **33** AND FIND THE SECOND CHILD. WRITE THE NAME, LINE NUMBER, AND RANK NUMBER OF THE CHILD IN THE SPACE BELOW THE TABLE.

## INTRODUCTION AND CONSENT

Hello. My name is \_\_\_\_\_. I am working with the Agency on Statistics under the President of the Republic of Tajikistan. We are conducting a survey about health and other topics all over Tajikistan. The information we collect will help the government to plan health services. Your household was selected for the survey. The questions usually take about 30 to 60 minutes. All of the answers you give will be confidential and will not be shared with anyone other than members of our survey team. You don't have to be in the survey, but we hope you will agree to answer the questions since your views are important. If I ask you any question you don't want to answer, just let me know and I will go on to the next question or you can stop the interview at any time.

In case you need more information about the survey, you may contact the person listed on the card that has already been given to your household.

Do you have any questions?  
May I begin the interview now?

| 403  | Now I would like to ask some questions about your pregnancies in the last 3 years. We will talk about each separately, starting with the last one you had.                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |       |

| FA01 | <p>As part of this survey, we would like to visit the health facility in which (NAME IN 503) got vaccinated. We would like to have your permission to copy the vaccination dates from (NAME IN 503) child 's development card, the child's vaccination card, or immunization register kept in a health facility. With your permission, our team supervisor will visit the health facility and copy the vaccination dates of (NAME IN 503) from these cards directly to the same questionnaire I am using right now for our interview. The information will be kept confidential and will not be shared with anyone other than members of our survey team. We hope you will allow access to the child's development card, vaccination card, and immunization register because information about (NAME IN 503) vaccinations is very important. The information will complement the information that we obtained from you in this interview. Many dangerous childhood illnesses such as measles or tetanus can be prevented through timely and effective vaccination. The information from the child development card, vaccination card and immunization register will assist the government to develop programs to protect children from vaccine preventable diseases and reduce childhood mortality and morbidity in Tajikistan.</p> <p>Do you have any questions?</p> <p>Will you allow us to copy vaccination records from (NAME IN 503) child development card, vaccination card and immunization register kept at the health facility?</p> <p>CIRCLE THE CODE AND SIGN YOUR NAME.</p> | <p>GRANTED ..... 1</p> <p>_____ INTERVIEWER'S SIGNATURE ←</p> <p>REFUSED ..... 2</p> <p>NOT PRESENT/ OTHER ..... 3</p>                                         | <p>→ 530</p> |

| CD08 | In the past 3 years, have you been told by a doctor or other healthcare worker that you have high blood sugar or diabetes?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | YES ..... 1<br>NO ..... 2                                                                                                                                                                                                                                                                                                           |        |  |  |  |
| 1103 | Has a doctor or other healthcare provider examined your breasts to check for breast cancer?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | YES ..... 1<br>NO ..... 2<br>DON'T KNOW ..... 8                                                                                                                                                                                                                                                                                     |        |  |  |  |
| 1104 | Now I'm going to ask you about tests a healthcare worker can do to check for cervical cancer, which is cancer in the cervix. The cervix connects the womb to the vagina. To be checked for cervical cancer, a woman is asked to lie on her back with her legs apart. Then the healthcare worker will use a brush or swab to collect a sample from inside her. The sample is sent to a laboratory for testing. This test is called a Pap smear or HPV test. Another method is called a VIA or Visual Inspection with Acetic Acid. In this test, the healthcare worker puts vinegar on the cervix to see if there is a reaction. |                                                                                                                                                                                                                                                                                                                                     |        |  |  |  |
| 1105 | Has a doctor or other healthcare worker ever tested you for cervical cancer?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | YES ..... 1<br>NO ..... 2<br>DON'T KNOW ..... 8                                                                                                                                                                                                                                                                                     |        |  |  |  |
| 1106 | Now I would like to ask you some questions on smoking and tobacco use. Do you currently smoke cigarettes every day, some days, or not at all?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | EVERY DAY ..... 1<br>SOME DAYS ..... 2<br>NOT AT ALL ..... 3                                                                                                                                                                                                                                                                        | → 1108 |  |  |  |

So far we have been talking about the behavior of your (current/last) (husband/male partner). Now I want to ask you about the behavior of any previous husband or any other current or previous male partner that you may have ever had.                                                          | B. How long ago did this last happen?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                |                   |                |                |                                                            |  |  |  |                                                                                                                                                                |     |   |   |                                                                                                                                                                                                  |     |   |   |                                                                                                                                                                                                                                   |     |   |   |  |

| 119 | ASK CONSENT FOR ANEMIA TEST FROM PARENT/RESPONSIBLE ADULT:<br><br>As part of this survey, we are asking people all over the country to take an anemia test. Anemia is a serious health problem that usually results from poor nutrition, infection, or chronic disease. This survey will assist the government to develop programs to prevent and treat anemia. We ask that all children under age 5 take part in anemia testing. The anemia test requires a few drops of blood from a finger or heel. The equipment used to take the blood is clean and completely safe. It has never been used before and will be thrown away after each test.<br><br>The blood will be tested for anemia immediately, and the result will be told to you right away. The result will be kept strictly confidential and will not be shared with anyone other than members of our survey team.<br><br>Do you have any questions? |                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| 119 | ASK CONSENT FOR ANEMIA TEST FROM PARENT/RESPONSIBLE ADULT:<br><br>As part of this survey, we are asking people all over the country to take an anemia test. Anemia is a serious health problem that usually results from poor nutrition, infection, or chronic disease. This survey will assist the government to develop programs to prevent and treat anemia. We ask that all children under age 5 take part in anemia testing. The anemia test requires a few drops of blood from a finger or heel. The equipment used to take the blood is clean and completely safe. It has never been used before and will be thrown away after each test.<br><br>The blood will be tested for anemia immediately, and the result will be told to you right away. The result will be kept strictly confidential and will not be shared with anyone other than members of our survey team.<br><br>Do you have any questions? |                                                                                                                                               |

| 119 | ASK CONSENT FOR ANEMIA TEST FROM PARENT/RESPONSIBLE ADULT:<br><br>As part of this survey, we are asking people all over the country to take an anemia test. Anemia is a serious health problem that usually results from poor nutrition, infection, or chronic disease. This survey will assist the government to develop programs to prevent and treat anemia. We ask that all children under age 5 take part in anemia testing. The anemia test requires a few drops of blood from a finger or heel. The equipment used to take the blood is clean and completely safe. It has never been used before and will be thrown away after each test.<br><br>The blood will be tested for anemia immediately, and the result will be told to you right away. The result will be kept strictly confidential and will not be shared with anyone other than members of our survey team.<br><br>Do you have any questions?<br>You can say yes or no. It is up to you to decide. |                                                                                                                                            |       |

Anemia is a serious health problem that usually results from poor nutrition, infection, or chronic disease. This survey will assist the government to develop programs to prevent and treat anemia.<br><br>For the anemia testing, we will need a few drops of blood from a finger. The equipment used to take the blood is clean and completely safe. It has never been used before and will be thrown away after we take your blood. The blood will be tested for anemia immediately, and the result will be told to you right away. The result will be kept strictly confidential and will not be shared with anyone other than members of our survey team.<br><br>Do you have any questions?<br>You can say yes or no. It is up to you to decide.<br>Will you take the anemia test? |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Anemia is a serious health problem that usually results from poor nutrition, infection, or chronic disease. This survey will assist the government to develop programs to prevent and treat anemia.<br><br>For the anemia testing, we will need a few drops of blood from a finger. The equipment used to take the blood is clean and completely safe. It has never been used before and will be thrown away after each test. The blood will be tested for anemia immediately, and the result will be told to you and (NAME OF MINOR) right away. The result will be kept strictly confidential and will not be shared with anyone other than members of our survey team.<br><br>Do you have any questions?<br>You can say yes or no. It is up to you to decide.<br>Will you allow (NAME OF MINOR) to take the anemia test? |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>MINOR RESPONDENT ASSENT</b>                 | 222                                                                                                                                                                                                      | <p><b>ASK ASSENT FOR ANEMIA TEST FROM MINOR RESPONDENT:</b></p> <p>As part of this survey, we are asking people all over the country to take an anemia test. Anemia is a serious health problem that usually results from poor nutrition, infection, or chronic disease. This survey will assist the government to develop programs to prevent and treat anemia.</p> <p>For the anemia testing, we will need a few drops of blood from a finger. The equipment used to take the blood is clean and completely safe. It has never been used before and will be thrown away after we take your blood. The blood will be tested for anemia immediately, and the result will be told to you and (NAME OF PARENT/RESPONSIBLE ADULT) right away. The result will be kept strictly confidential and will not be shared with anyone other than members of our survey team.</p> <p>Do you have any questions?<br/>You can say yes or no. It is up to you to decide.<br/>Will you take the anemia test?</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Anemia is a serious health problem that usually results from poor nutrition, infection, or chronic disease. This survey will assist the government to develop programs to prevent and treat anemia.</p> <p>For the anemia testing, we will need a few drops of blood from a finger. The equipment used to take the blood is clean and completely safe. It has never been used before and will be thrown away after we take your blood. The blood will be tested for anemia immediately, and the result will be told to you right away. The result will be kept strictly confidential and will not be shared with anyone other than members of our survey team.</p> <p>Do you have any questions?<br/>You can say yes or no. It is up to you to decide.<br/>Will you take the anemia test?</p> |                                                                                                                                                                                                                                                                                                                                                                                                         |

Anemia is a serious health problem that usually results from poor nutrition, infection, or chronic disease. This survey will assist the government to develop programs to prevent and treat anemia.</p> <p>For the anemia testing, we will need a few drops of blood from a finger. The equipment used to take the blood is clean and completely safe. It has never been used before and will be thrown away after each test. The blood will be tested for anemia immediately, and the result will be told to you and (NAME OF MINOR) right away. The result will be kept strictly confidential and will not be shared with anyone other than members of our survey team.</p> <p>Do you have any questions?<br/>You can say yes or no. It is up to you to decide.<br/>Will you allow (NAME OF MINOR) to take the anemia test?</p> |                                                                                                                                                                                                                                                                                                                                                                                                         |

| MINOR<br>RESPONDENT<br>ASSENT                  | 222   | <p>ASK ASSENT FOR ANEMIA TEST FROM MINOR RESPONDENT:</p> <p>As part of this survey, we are asking people all over the country to take an anemia test. Anemia is a serious health problem that usually results from poor nutrition, infection, or chronic disease. This survey will assist the government to develop programs to prevent and treat anemia.</p> <p>For the anemia testing, we will need a few drops of blood from a finger. The equipment used to take the blood is clean and completely safe. It has never been used before and will be thrown away after we take your blood. The blood will be tested for anemia immediately, and the result will be told to you and (NAME OF PARENT/RESPONSIBLE ADULT) right away. The result will be kept strictly confidential and will not be shared with anyone other than members of our survey team.</p> <p>Do you have any questions?<br/>You can say yes or no. It is up to you to decide.<br/>Will you take the anemia test?</p> |                                                                                                                                                                                                                                                                                                                                                                                                             |
