**January 2025**

The 2023 Tajikistan Demographic and Health Survey (2023 TjDHS) was implemented by the Agency on Statistics under the President of the Republic of Tajikistan in coordination with the Ministry of Health and Social Protection of the Population. The funding for the 2023 TjDHS was provided by the Government of Tajikistan, and the United States Agency for International Development (USAID). UNICEF and UNFPA provided additional support. ICF provided technical assistance through The DHS Program, a USAID-funded project providing support and technical assistance in the implementation of population and health surveys in countries worldwide.

Additional information about the 2023 TjDHS may be obtained from the Agency on Statistics under the President of the Republic of Tajikistan, 17 Bohktar Street, Dushanbe, Tajikistan; telephone: +992-37-241-14-45; email: [stat@tojikiston.com](mailto:stat@tojikiston.com); internet: <https://www.stat.tj>.

# ACKNOWLEDGMENTS

---

The Agency on Statistics under the President of the Republic of Tajikistan (Tajstat) is pleased to present the results of the 2023 Tajikistan Demographic and Health Survey (TjDHS). This survey was funded by the United States Agency for International Development (USAID). Additional support was provided by the United Nations Children’s Fund (UNICEF) and United Nations Population Fund (UNFPA) in Tajikistan. The 2023 TjDHS is the third DHS survey to be undertaken in the country.

Tajstat wishes to express its appreciation to the following organizations and groups:

- The Ministry of Health and Social Protection of Population of the Republic of Tajikistan.
- The Demographic and Health Surveys (DHS) Program/ICF for technical support, training of fieldwork staff, consultations, recommendations, and analysis of the data collected.
- The 2023 TjDHS Interagency Coordination Committee for technical assistance and timely support in the implementation of this work.

In particular, Tajstat expresses appreciation to the following staff and consultants at The DHS Program/ICF for their technical support during all stages of survey design and implementation: Gulnara Semenov, Senior Survey Coordinator; Keith Purvis, Director, Software Application Engineer Lead; Jose Carlosama Cepeda, Data Processing Specialist; Ruilin Ren, Senior Sampling Coordinator; Eleanor Brindle, Biomarker Specialist; and Ikhtier Kholmatov, Data Processing Consultant.

We also wish to acknowledge the employees of the statistical system of the Republic of Tajikistan for their active participation in and contribution to this work. Over 200 staff members from the Agency on Statistics under the President of the Republic of Tajikistan, working in regional, city, and rayon branches of the agency as well as in the State Leading Information Centre, participated in the survey.

We hereby extend our gratitude to the Government of Tajikistan and to the representatives of local authorities for their support and assistance during the survey process.

Above all, we appreciate the cooperation of all of the survey respondents who have made the 2023 TjDHS a success.

This report was prepared as a joint effort of staff from the Agency on Statistics under the President of the Republic of Tajikistan and The DHS Program/ICF. The report presents important data and conclusions that will help in the development of effective strategies and programs in the field of health and demography, contributing to the improvement of the quality of life of the country’s population. We are confident that the results of the survey will serve as a reliable basis for informed decision making and further development of the Republic of Tajikistan.

Mr. Jamshed Nurmahmadzoda

Director, Agency on Statistics under the President of the Republic of Tajikistan  
National Coordinator, 2023 TjDHS

# READING AND UNDERSTANDING TABLES FROM THE 2023 TAJIKISTAN DEMOGRAPHIC AND HEALTH SURVEY (TjDHS)

The 2023 Tajikistan DHS final report is based on approximately 200 tables of data. For quick reference, they are located at the end of each chapter and can be accessed through links in the pertinent text (electronic version). Additionally, this more reader-friendly version features about 90 figures that clearly highlight trends, subnational patterns, and background characteristics. Large, colorful maps display breakdowns for five administrative regions in Tajikistan. The text has been simplified to highlight key points in bullets and to clearly identify indicator definitions in boxes.

While the text and figures featured in each chapter highlight some of the most important findings from the tables, not every finding can be discussed or displayed graphically. For this reason, TjDHS data users should be comfortable reading and interpreting tables.

The following pages provide an introduction to the organization of TjDHS tables and the presentation of background characteristics, along with a brief summary of sampling and understanding denominators. In addition, this section provides some exercises for users as they practice their new skills in interpreting TjDHS tables.

## Example 1: Exposure to mass media

A Question Asked of All Survey Respondents

| Table 3.4 Exposure to mass media 1                                                                                                              |                                        |                                         |                                           |                                               |                                                       |                   |
|-------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------|-----------------------------------------|-------------------------------------------|-----------------------------------------------|-------------------------------------------------------|-------------------|
| Percentage of women age 15–49 who are exposed to specific media on a weekly basis, according to background characteristics, Tajikistan DHS 2023 |                                        |                                         |                                           |                                               |                                                       |                   |
| Background characteristic 3                                                                                                                     | Reads a newspaper at least once a week | Watches television at least once a week | Listens to the radio at least once a week | Accesses all three media at least once a week | Accesses none of the three media at least once a week | Number of women 2 |

| <b>Total</b>                                                                                                                                    | 19.0                                   | 66.3                                    | 9.0                                       | 5.4                                           | 31.0                                                  | 9,879             |

**Step 1:** Read the title and subtitle, highlighted in orange in the table above. They tell you the topic and the specific population group being described. In this case, the table is about women age 15–49 and their exposure to different types of media. All eligible female respondents age 15–49 were asked these questions.

**Step 2:** Scan the column headings—highlighted in green in Example 1. They describe how the information is categorized. In this table, the first three columns of data show different types of media that women access at least once a week. The fourth column shows women who access all three types of media, while the fifth column shows women who do not access any of the three types of media on a weekly basis. The last column lists the number of women age 15–49 interviewed in the survey.

**Step 3:** Scan the row headings—the first vertical column highlighted in blue in Example 1. These show the different ways the data are divided into categories based on population characteristics. In this case, the table presents women’s exposure to media by age, urban-rural residence, region, level of education, and wealth quintile. Most of the tables in the TjDHS report will be divided into these same categories.

**Step 4:** Look at the row at the bottom of the table highlighted in pink. These percentages represent the totals of all women age 15–49 and their weekly access to different types of media. In this case, 19.0% of women age 15–49 read a newspaper at least once a week, 66.3% watch television at least weekly, and 9.0% listen to the radio on a weekly basis.\*

**Step 5:** Draw two imaginary lines, as shown on the table, to find out what percentage of women with a higher education listen to the radio at least once a week. This shows that 20.2% of women age 15–49 with a higher education listen to the radio at least once a week.

By looking at patterns by background characteristics, we can see how exposure to mass media varies across Tajikistan. Mass media are often used to communicate health messages. Knowing how mass media exposure varies among different groups can help program planners and policymakers determine how to most effectively reach their target populations.

\*For the purpose of this document data are presented exactly as they appear in the table, including decimal places. However, the text in the remainder of this report rounds data to the nearest whole percentage point.

**Practice:** Use the table in Example 1 to answer the following questions:

- What percentage of women in Tajikistan do not access any of the three media at least once a week?
- Which age group of women is most likely to watch television at least once a week?
- Compare women in urban areas with women in rural areas—which group is more likely to listen to the radio on a weekly basis?
- Compare women within the regions—which region has the highest percentage of women who access all three media at least once a week?
- What are the lowest and the highest percentages (range) of women who read a newspaper at least once a week by region?
- Is there a clear pattern in watching television at least once a week by wealth quintile?

**Answers:**

- 31.0%.
- Women age 15–19: 72.3% of women in this age group watch television at least once a week.
- Women in urban areas: 12.0% of women in urban areas listen to the radio at least once a week, as compared with 7.9% of women in rural areas.
- Dushanbe: 9.6% of women in Dushanbe access all three media at least once a week.
- By region, the percentage of women who read a newspaper at least once a week ranges from a low of 9.3% in Khatlon to a high of 36.5% in GBAO.
- Yes. Weekly exposure to television increases as household wealth increases: 54.5% of women in the lowest wealth quintile watch television at least once a week, compared with 65.2% of women in the middle quintile and 75.9% of women in the highest quintile.

## Example 2: Children with diarrhea and care seeking for diarrhea

A Question Asked of a Subgroup of Survey Respondents

| Note: Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.                                                                                                       |                                                                                                                                                              |                    |                                                                 |                                                                                    |

**Step 1:** Read the title and subtitle. In this case, the table is about two separate groups of children: all children under age 5 (a) and children under age 5 with diarrhea in the 2 weeks preceding the survey (b).

**Step 2:** Identify the two panels. First, identify the columns that refer to all children under age 5 (a), and then isolate the columns that refer only to children under age 5 with diarrhea in the 2 weeks preceding the survey (b).

**Step 3:** Look at the first panel. What percentage of children under age 5 had diarrhea in the 2 weeks preceding the survey? It is 16.4%. Now look at the second panel. How many children under age 5 had diarrhea in the 2 weeks before the survey? It's 839, or 16.4% of the 5,132 children (with rounding). The second panel is a subset of the first panel.

**Step 4:** Only 16.4% of children under age 5 had diarrhea in the 2 weeks before the survey. Once these children are further divided into the background characteristic categories, there may be too few cases for the percentages to be reliable.

- What percentage of children with diarrhea in Gorno-Badakhshan Autonomous Oblast (GBAO) were taken for advice or treatment? It's 31.2%. This percentage is in parentheses because there are between 25 and 49 children (unweighted) in this category. Readers should use this number with caution—it may not be reliable. (For more information on weighted and unweighted numbers, see Example 3.)
- What percentage of children with diarrhea living in households with an unimproved source of drinking water were taken for advice or treatment? There is no number in this cell—only an asterisk. This is because fewer than 25 children (unweighted) living in households with an unimproved source of drinking water had advice or treatment sought. Results for this group are not reported. The subgroup is too small, and therefore the data are not reliable.

**Note:** When parentheses or asterisks are used in a table, the explanation will be noted under the table. If there are no parentheses or asterisks in a table, you can proceed with confidence that enough cases were included in all categories that the data are reliable.

### Example 3: Understanding Sampling Weights in TjDHS Tables

A sample is a group of people who have been selected for a survey. In the TjDHS, the sample is designed to represent the national population age 15–49. In addition to national data, most countries want to collect and report data on smaller geographical or administrative areas. However, doing so requires a large enough sample size in each area. For the 2023 TjDHS, the survey sample is representative at the national and regional levels and for urban and rural areas.

| Total                                                                                               | 100.0              | 9,879             | 9,879               |

To generate statistics that are representative of the country as a whole and the five regions, the number of women surveyed in each region should contribute to the size of the total (national) sample in proportion to size of the region. However, if some regions have small populations, then a sample allocated in proportion to each region’s population may not include sufficient women from each region for analysis. To solve this problem, regions with small populations are oversampled. For example, let’s say that you have enough money to interview 9,879 women and want to produce results that are representative of Tajikistan as a whole and its regions (as in Table 3.1). However, the total population of Tajikistan is not evenly distributed among the regions: some regions, such as Khatlon, are heavily populated while others, such as GBAO, are not. Thus, GBAO must be oversampled.

A sampling statistician determines how many women should be interviewed in each region in order to get reliable statistics. The **blue column (1)** in the table above shows the actual number of women interviewed in each region. Within the regions, the number of women interviewed ranges from 815 in GBAO to 2,664 in Khatlon. The number of interviews is sufficient to get reliable results in each region.

With this distribution of interviews, some regions are overrepresented and some regions are underrepresented. For example, the population in Khatlon is 35.5% of the population in Tajikistan, while GBAO’s population contributes only 1.6% of the country’s population. But as the blue column shows, the number of women interviewed in Khatlon accounts for only about 27% of the total sample of women interviewed ( $2,664/9,879$ ) and the number of women interviewed in GBAO accounts for 8% of women interviewed ( $815/9,879$ ). This unweighted distribution of women does not accurately represent the population.

In order to get statistics that are representative of Tajikistan, the distribution of the women in the sample needs to be weighted (or mathematically adjusted) such that it resembles the true distribution in the country. Women from a small region, like GBAO, should contribute only a small amount to the national total. Women from a large region, like Khatlon, should contribute much more. Therefore, DHS statisticians mathematically calculate a “weight” that is used to adjust the number of women from each region so that each region’s contribution to the total is proportional to the actual population of the region. The numbers in the **purple column (2)** represent the “weighted” values. The weighted values can be smaller or larger than the unweighted values at the regional level. The total national sample size of 9,879 women has not changed after weighting, but the distribution of the women in the regions has been changed to represent their contribution to the total population size.

How do statisticians weight each category? They take into account the probability that a woman was selected in the sample. If you were to compare the **green column (3)** to the actual population distribution of Tajikistan, you would see that women in each region are contributing to the total sample with the same weight that they contribute to the population of the country. The weighted number of women in the survey

now accurately represents the proportion of women who live in Khatlon and the proportion of women who live in GBAO.

With sampling and weighting, it is possible to interview enough women to provide reliable statistics at national and regional levels. In general, only the weighted numbers are shown in each of the TjDHS tables, so don't be surprised if these numbers seem low: they may actually represent a larger number of women interviewed.

# SUSTAINABLE DEVELOPMENT GOAL INDICATORS

## Sustainable Development Goal Indicators—Tajikistan DHS 2023

na = not applicable

<sup>1</sup> Persons living in households that report the primary source of lighting is electricity

<sup>2</sup> Persons living in households that report no cooking, no space heating, or no lighting are not excluded from the numerator.

<sup>3</sup> Expressed in terms of deaths per 1,000 live births for the 5-year period preceding the survey

<sup>4</sup> Equivalent to the age-specific fertility rate for girls age 10–14 for the 3-year period preceding the survey, expressed in terms of births per 1,000 girls age 10–14

<sup>5</sup> Equivalent to the age-specific fertility rate for women age 15–19 for the 3-year period preceding the survey, expressed in terms of births per 1,000 women age 15–19

<sup>6</sup> Data are not age-standardized and are available for women age 15–49 only.

<sup>7</sup> The percentage of children age 12–23 months who received three doses of DPT-HepB-Hib vaccine

<sup>8</sup> The percentage of children age 24–35 months who received one dose of MR or MMR-1

<sup>9</sup> The percentage of children age 24–35 months who received three doses of pneumococcal conjugate vaccine

<sup>10</sup> Data are available for women age 15–49 who have ever been in union only.

<sup>11</sup> In the DHS, psychological violence is termed emotional violence.

<sup>12</sup> Data are available for women age 15–49 only.

<sup>13</sup> Data are available for currently married women only.

<sup>14</sup> Data are available for women age 15–49 only.

<sup>15</sup> Data are available for children age 1–14 only.

<sup>16</sup> Data are available for women only.

<sup>17</sup> Data are available for women age 15–49 who have used the internet in the last 12 months.

**TAJIKISTAN**

The 2023 Tajikistan Demographic and Health Survey (TjDHS) is the third Demographic and Health Survey conducted in Tajikistan. The 2023 TjDHS was implemented by the Agency on Statistics under the President of the Republic of Tajikistan (Tajstat) in coordination with the Ministry of Health and Social Protection of Population (MoHSPP). Data collection took place from August 10 to November 28, 2023. ICF provided technical assistance through The Demographic and Health Surveys Program (DHS), which is funded by the United States Agency for International Development (USAID) and offers financial support and technical assistance for population and health surveys in countries worldwide. Other agencies and organizations that facilitated the successful implementation of the survey through technical or financial support were the United Nations Children's Fund (UNICEF) and the United Nations Population Fund (UNFPA).

## 1.1 SURVEY OBJECTIVES

The primary objective of the 2023 TjDHS is to provide up-to-date estimates of basic demographic and health indicators. Specifically, the survey collected information on fertility and contraceptive use, maternal and child health and nutrition, childhood mortality, domestic violence against women, child discipline, awareness and behavior regarding HIV/AIDS and other sexually transmitted infections (STIs), and other health-related issues such as smoking.

The information collected through the 2023 TjDHS is intended to assist policymakers and program managers in designing and evaluating programs and strategies for improving the health of the country's population. The survey also provides indicators relevant to the Sustainable Development Goals (SDGs) for Tajikistan.

## 1.2 SAMPLE DESIGN

The sampling frame used for the 2023 TjDHS is the 2020 Tajikistan Population and Housing Census (TPHC), conducted by Tajstat. Administratively, Tajikistan is divided into five administrative regions: Dushanbe City, Districts of Republican Subordination (DRS), Sughd, Khatlon, and Gorno-Badakhshan Autonomous Oblast (GBAO). Each region is subdivided into urban and rural areas. The country is divided into 68 cities and rayons (districts) distributed over the country's regions. Each city or rayon (district) is further divided into census divisions, which are subdivided into instruction areas. Each instruction area is divided into enumeration areas (EAs).

The sampling frame for the 2023 TjDHS is a list of EAs covering all urban and rural areas of the country, with the primary sampling units (PSUs) being EAs in urban and rural areas. An EA is a geographical area, usually a city block, consisting of an adequate number of households for efficient counting; each EA serves as a counting unit for the population census. The 2020 TPHC did not use EA maps. Urban EAs can be identified through a list of structures/households in the EA together with a description file. In rural areas, an EA is a natural village if small or part of a large village. Rural EAs can be identified with help from the village administration.

The sample was designed to yield representative results for the country as a whole, urban and rural areas separately, and each of the five administrative regions. In addition, as in the previous TjDHS survey, the sample was designed to allow certain indicators to be presented for the 12 districts in the Khatlon region covered under the Feed the Future program (FTF); these 12 districts were combined as a single FTF domain. The sampling frame excluded institutional populations such as persons in hotels, barracks, and prisons.

The 2023 TjDHS followed a stratified two-stage sample design. The first stage involved selecting sample points (clusters) consisting of EAs. EAs were drawn with a probability proportional to their size within each sampling stratum. A total of 370 clusters were selected, 166 in urban areas and 204 in rural areas.

The second stage involved systematic sampling of households. A household listing operation was undertaken in all of the selected clusters, and a fixed number of 22 households per cluster were selected through an equal probability systematic selection process, for a total sample size of approximately 8,140 households.

All women age 15–49 who were either permanent residents of the selected households or visitors who stayed in the households the night before the survey were eligible to be interviewed. Hemoglobin testing was performed in each household among eligible women age 15–49 who consented to being tested. With the parent’s or guardian’s consent, children age 6–59 months were also tested for anemia in each household. Height and weight information was collected from eligible women age 15–49 and children age 0–59 months in all households. Also, one eligible woman in each household was randomly selected to be asked additional questions about domestic violence.

### 1.3 QUESTIONNAIRES

Three questionnaires were used in the 2023 TjDHS: the Household Questionnaire, the Woman’s Questionnaire, and the Biomarker Questionnaire. The questionnaires, based on The DHS Program’s model questionnaires, were adapted to reflect the population and health issues relevant to Tajikistan. Suggestions were solicited from various stakeholders representing government ministries and agencies, nongovernmental organizations, and international donors. After all questionnaires were finalized in English, they were translated into Russian and Tajik.

The Household Questionnaire was used to list all members of and visitors to selected households. Basic demographic information was collected on each person listed, including age, sex, marital status, education, and relationship to the head of the household. For children under age 18, parents’ survival status was determined. The data on age and sex were used to identify women who were eligible for individual interviews. The Household Questionnaire also collected information on child discipline for one randomly selected child age 1–14 per household as well as information on the characteristics of the household’s dwelling unit, such as source of water; type of toilet facilities; materials used for flooring, external walls, and roofing; labor migration, household remittances and ownership of various durable goods.

The Woman’s Questionnaire was used to collect information from all eligible women age 15–49. These women were asked questions on the following topics:

- Background characteristics: age, date of birth, duration of residency, previous residency, literacy, education, access to media, mobile and smart mobile phone ownership, and internet use
- Reproduction: number of children ever born, pregnancy history, reasons for abortion, child mortality, current pregnancy, and age at first menstrual period
- Contraception: knowledge and use of contraception, sources of contraceptive methods, and family planning
- Pregnancy and postnatal care, child immunization, and health and nutrition: prenatal, delivery, and postnatal care; breastfeeding and complementary feeding practices; vaccination coverage; prevalence of and care seeking for diarrhea, acute respiratory infection (ARI), and fever; use of oral rehydration therapy; infant and young child feeding (IYCF) practices; and dietary diversity
- Marriage and sexual activity: marital status, age at first marriage, age at first sexual intercourse, recent sexual activity, number and types of sexual partners, co-wives, and use of condoms

- Fertility preferences: desire for more children, ideal number of children, gender preferences, intention to use family planning and who is making this decision, pressure to become pregnant, and exposure to media messages about family planning
- Husbands' background characteristics and women's work: husband's age, level of education, and occupation and respondent's occupation, sources of earnings, participation in decision making, house ownership, and attitude towards wife beating
- HIV/AIDS: knowledge of AIDS, knowledge of routes of HIV transmission, behavior to avoid STIs and AIDS, stigma, and history of HIV testing
- Other health issues: alcohol consumption and smoking, breast exams, cervical cancer tests, problems in accessing health care, and noncommunicable diseases
- Domestic violence: information on the prevalence and incidence of physical, sexual, and emotional violence
- Calendar: a 5-year calendar of reproductive events (births, pregnancies, pregnancy terminations, pregnancy duration, and contraceptive use)

Because home-based vaccination records are rare in Tajikistan, the TjDHS also collected child vaccination data from health facilities following a protocol identical to that used in the 2012 and 2017 TjDHS surveys. Specifically, vaccination data were collected from mothers, either by viewing the home-based record or through mothers' recall, and from facility-based health vaccination cards. For the latter, consenting mothers provided the address of the facility and the name of the provider; the team supervisor then visited the health facility and copied the records of each eligible child.

The Biomarker Questionnaire was used to record the results of anthropometry measurements and hemoglobin testing.

In addition, a self-administered Fieldworker Questionnaire collected information about the survey's fieldworkers: team supervisors, interviewers, and health investigators.

The 2023 TjDHS survey methodology and instruments were approved by the ICF Institutional Review Board. By law, Tajstat is mandated to conduct population-based surveys in Tajikistan, and local institutional review board approval is not required for the TjDHS. The Government of Tajikistan assigned Tajstat to implement the 2023 TjDHS in collaboration with the Ministry of Health and Social Protection of Population; the government also issued the edict for the creation of the 2023 TjDHS Interagency Steering Committee, which oversaw the approved survey implementation plan and protocols.

## 1.4 ANTHROPOMETRY AND ANEMIA TESTING

In addition to the data collected through interviews, the 2023 TjDHS incorporated two biomarkers: anthropometry and anemia testing. Data related to coverage of the anthropometric measures and the results of the anemia testing were recorded in the Biomarker Questionnaire. The protocol for anemia testing was reviewed and approved by the MoHSPP and the ICF Institutional Review Board.

**Anthropometry.** Weight measurements were taken using SECA scales with a digital display (model number SECA 874). Height and length were measured with a ShorrBoard® measuring board. Children younger than age 24 months were measured lying down (recumbent length), while older children and adults were measured standing (height).

To assess the precision of measurements, 10% of children per cluster were randomly selected to be measured a second time. The DHS Program defines a difference of less than 1 centimeter between the two height measurements as an acceptable level of precision. In addition to remeasurement of randomly

selected children, remeasurement of flagged cases was performed to ensure accurate reporting of height. Children with a z score of less than  $-3$  or more than  $3$  for height-for-age, weight-for-height, or weight-for-age were flagged and measured a second time. Once the height measurement was confirmed, parents or guardians of children with a z score of  $-3$  or less for weight-for-height were provided with a referral for severe acute malnutrition and instructed to take the child to a health facility for follow-up care.

**Anemia.** Blood specimens for anemia testing were collected from women age 15–49 who consented to be tested. Blood specimens were also collected from children age 6–59 months whose parents or guardians had given consent to the testing. Capillary blood was drawn from a finger prick (or a heel prick in the case of children age 6–11 months) performed using a high-flow lancet (BD 366594). The third drop of capillary blood was collected in a HemoCue® 201+ microcuvette. Hemoglobin analysis was carried out on-site using a battery-operated portable HemoCue 201+ device. Results were provided verbally and in writing to those being tested. Parents or guardians of children with a hemoglobin level below 8 g/dl were provided with a referral and instructed to take the child to a health facility for follow-up care. Likewise, adults were referred for follow-up care if their hemoglobin levels were below 8 g/dl.

## 1.5 PRETEST AND CAPI TRAINING OF TRAINERS

Eleven women participated in training to pretest the TjDHS survey questionnaires over a 4-week period from May 10 through June 3, 2023. Classroom training, which took place from May 10 through May 21, focused on questionnaire content. Also, trainees visited a local health facility to practice recording vaccination dates from children's health cards and other vaccination forms kept at the facility. From May 22 through May 29, participants were instructed on using the computer-assisted personal interviewing (CAPI) system, an electronic data capture system programmed on tablet computers that the participants used to implement the survey. Staff from The DHS Program and an ICF consultant based in Dushanbe led the training in Russian and Tajik with support from Tajstat personnel. In addition, senior subject specialists from the MoHSPP attended the sessions to provide technical background on topics such as family planning and reproductive health, childhood immunization, and child health and nutrition. Abduvali Nabizoda from Tajstat delivered a lecture in Tajik on gender-based violence in Tajikistan.

The biomarker classroom portion of the training commenced on May 19 and continued through May 29, 2023. The biomarker training was attended by six participants, all of whom were medically trained specialists. The training, led by staff from The DHS Program in English with consecutive translation to Russian or Tajik, included classroom instruction focusing on anthropometry measurements, anemia testing, and recording of results in the paper Biomarker Questionnaire. The training was divided into three parts: classroom training on anthropometry and anemia, in-class standardization of tests and practice sessions, and fieldwork with interviewers. Classroom training of health investigators (a mixture of women and men) was conducted at the same venue as the training of interviewers, which allowed for close interactions between health investigators and interviewers.

The pretest fieldwork was conducted from May 30 through June 2, 2023. Interviewers and health investigators were divided into three teams and worked in the Districts of Republican Subordination, Rudaki district, and Chorgulteppa (in both urban and rural areas). A total of 72 women's interviews and 48 household interviews were conducted, and 36 Biomarker Questionnaires were completed. Most interviews were conducted in Tajik. Forty-four women were measured and tested for anemia; among children, 30 were measured and 25 were tested for anemia. At the end of each day, both during and after the pretest fieldwork, debriefing sessions were held and questionnaires were modified based on lessons drawn from the exercise.

The CAPI training of trainers started on June 5 and lasted for 5 days. Six information technology (IT) experts from Tajstat were assigned to attend the training of trainers, most of whom had previously taken part in the pretest training. The goals of the training were to provide CAPI system technical content and

training materials and strengthen participants' training facilitation skills so that they could play a leadership role in the main training.

## 1.6 TRAINING OF FIELD STAFF

Eighty-three people (all women) participated in the 4-week main training course on interviewing, which consisted of lectures, demonstrations, and practice interviews. The training for TjDHS health investigators was attended by 35 trainees (24 women and 11 men), all of whom had some form of clinical training or medical research background.

The training of trainers for interviewers was conducted on July 3–5, 2023, prior to the main training. The purpose of the training of trainers was to prepare master trainers for the main training course. Seven trainers (all women) were selected, based on performance, from the 11 participants in the pretest. The trainers were recruited through the Tajstat regional offices; they later served as team supervisors, quality control field monitors, or regional coordinators during the 2023 TjDHS data collection.

The main fieldwork training, conducted from July 6 through August 4, 2023, was led by the seven master trainers and backstopped by staff from The DHS Program. The interviewer training was conducted in Tajik, and sessions included discussions of concepts, procedures, and survey methodology. Participants were guided through the questionnaires. In addition, senior subject specialists from the MoHSPP attended the sessions to provide background on topics including family planning, reproductive health, childhood immunization, and child health and nutrition. As with the pretest training, Abduvali Nabizoda from Tajstat delivered a lecture on gender-based violence in Tajikistan. The training included presentations, lectures, hands-on exercises, mock interviews, role plays, group work, tutorial videos, and quizzes. In-class exercises included probing for age, checking age consistency, copying information from the vaccination cards, completing the reproductive calendar, and practicing interviews. Also, participants received training on how to test household salt for iodine.

Once training on use of paper questionnaires concluded, Tajstat staff and an ICF consultant based in Dushanbe conducted a weeklong training course on computer-assisted personal interviewing in Tajik with backstopping by data processing staff from The DHS Program. The training, which took place from July 19 through July 28, 2023, was facilitated by five IT specialists who had attended the CAPI training of trainers. Participants learned about features of the data collection system, different scenarios and technical issues typically encountered during fieldwork, and ways to resolve issues.

The biomarker classroom portion of the training commenced on July 19 and continued through July 28, 2023. This training was led by staff from The DHS Program with assistance from the two biomarker master trainers. The biomarker training was also supported by three additional trainers who attended the pretest and demonstrated proficiency in all of the biomarker procedures. Training materials were presented in Russian with additional explanation in Tajik when necessary to aid the trainees in comprehension.

The biomarker training was divided into four parts: (1) classroom training on the 2023 TjDHS process, eligibility criteria, informed consent, and proper recording of results in the paper Biomarker Questionnaire; (2) classroom and practical training in the DHS techniques for anthropometry, including standardization exercises; (3) classroom and practical training in capillary blood collection and anemia testing; and (4) fieldwork practice with interviewers. Classroom training of the health investigators was conducted at the same venue as the interviewer training, allowing for close interactions between the health investigators and interviewers.

To give the biomarker training participants hands-on experience prior to field practice, the health investigators practiced skills with each other and with Tajstat staff, staff from The DHS Program, and interviewers. Six mothers with children visited at the start of anthropometry training to allow live demonstrations of the measurement protocols with adults and children. Following these demonstrations and further classroom training in anthropometry techniques, anthropometry standardization exercises were

conducted at the training venue. Tajstat arranged for a total of approximately 110 children to be present at the training over the 5 days of practice and standardization.

During anthropometry sessions, health investigators were trained to measure the height and weight of children and adults. Inter-observer and intra-observer variations of the same measurements as well as the concepts of accuracy and precision were explained to the participants. Anthropometry training concluded with standardization exercises in which trainees were required to demonstrate proficiency in child height or length measurement. Restandardization exercises were offered for health investigators who did not meet the standardization criteria on the first attempt. Only those health investigators whose standardization scores demonstrated proficiency in child anthropometry were permitted to measure children during field data collection.

In addition, a special session on anthropometry was held with all team supervisors. On the final day of the classroom training sessions, staff from The DHS Program met with team supervisors to explain the use of checklists provided to aid them in overseeing the health investigators' work. Supervisors were also provided a summary of the remeasurement procedures in which the supervisor and the health investigators revisited approximately two to three children per cluster together for quality control checks of anthropometry measurements.

To improve team coordination, a joint classroom session involving the health investigators was also organized with the interviewers at Tajstat before the beginning of field practice. All training participants and Tajstat staff were given an overview of biomarker collection in the 2023 TjDHS. This overview described eligibility for biomarker collection, use of the Household and Biomarker Questionnaires to record data, appropriate procedures for obtaining informed consent, and supply packing and transportation logistics. Collecting data of high quality was emphasized. Also, participants received a brief tutorial on how to assist in taking anthropometric measurements.

Throughout the training, participants were evaluated via in-class exercises, quizzes, and observations made during field practice. At the end of the training, teams were formed by selecting supervisors, interviewers, and health investigators. The supervisors received additional training in data quality control procedures, fieldwork coordination, and management. They also received training on copying immunization records from MoHSPP form 63 and children's health cards directly to tablet computers.

Supervisors, interviewers, and health investigators were divided into 18 teams for field practice, with each team consisting of one supervisor, four interviewers, and two health investigators. Field practice took place in the Tesgar village of the DRS region in 18 clusters with prelisted residential households in nonsampled areas, giving the teams an opportunity to implement the survey in a real-world situation. Field practice took place over 3 days (July 29–31, 2023), and each interviewer visited a minimum of two households per day. During the field practice, a total of 269 women's interviews and 169 household interviews were completed. To allow for practice of biomarker collection, approximately 238 women were measured and 201 were tested for anemia. Among children, 174 were measured and 113 were tested for anemia.

## 1.7 FIELDWORK

Data collection was carried out by 15 field teams, each consisting of one female team supervisor, four female interviewers, and two health investigators (at least one of whom was female and at least one of whom was standardized for anthropometry). Fieldwork started in most regions on August 10, 2023, and ended on November 28, 2023.

Fieldwork monitoring was an integral part of the 2023 TjDHS. Senior TjDHS technical staff from Tajstat, along with three DHS quality control field monitors, three biomarker quality control field monitors, five field coordinators, and four CAPI coordinators, visited teams regularly to review work and monitor data quality. Also, representatives from The DHS Program visited teams to monitor data collection and to observe anemia testing and height and weight measurements of women and children under age 5. During

field visits, staff provided teams (supervisor, interviewers, and health investigators) with critical feedback to improve their performance. In addition, they used TjDHS field-check tables based on data from completed clusters to illustrate problems specific to each team visited. Field-check tables based on the completed questionnaires entered during fieldwork were generated in real time as fieldwork progressed and were available online via the SyncCloud platform. The tables were reviewed and discussed with the Tajstat staff on an ongoing basis to alert field teams to data quality issues found during the survey fieldwork and to ensure that quality data collection was maintained throughout the fieldwork.

## 1.8 DATA PROCESSING

The 2023 TjDHS used a Windows-based system. All electronic data files were transferred via a secure SyncCloud server to the Tajstat central office in Dushanbe, where they were stored on a password-protected computer. The data processing operation included secondary editing, which required resolution of computer-identified inconsistencies and coding of open-ended questions. The data were processed by five IT specialists/secondary editors who took part in the main fieldwork training, the training of trainers, and a refresher secondary editing training session; they were supervised remotely by staff from The DHS Program. Data editing was accomplished using CPro software. Secondary editing and data processing were initiated in December 2023 and completed in February 2024.

## 1.9 RESPONSE RATES

**Table 1.1** presents the response rates for the 2023 TjDHS. A total of 8,140 households were selected for the TjDHS sample, of which 8,070 were found to be occupied. Of the occupied households, 8,035 were successfully interviewed, yielding a response rate of over 99%. In the interviewed households, 9,930 women age 15–49 were identified as eligible for individual interviews. Interviews were completed with 9,879 women, yielding a response rate of over 99%.

**Table 1.1 Results of the household and individual interviews**

Number of households, number of interviews, and response rates, according to residence (unweighted), Tajikistan DHS 2023

| Result                                    | Residence |       | Total |
|-------------------------------------------|-----------|-------|-------|
|                                           | Urban     | Rural |       |
| <b>Household interviews</b>               |           |       |       |
| Households selected                       | 3,652     | 4,488 | 8,140 |
| Households occupied                       | 3,620     | 4,450 | 8,070 |
| Households interviewed                    | 3,597     | 4,438 | 8,035 |
| Household response rate <sup>1</sup>      | 99.4      | 99.7  | 99.6  |
| <b>Interviews with women age 15–49</b>    |           |       |       |
| Number of eligible women                  | 4,245     | 5,685 | 9,930 |
| Number of eligible women interviewed      | 4,218     | 5,661 | 9,879 |
| Eligible women response rate <sup>2</sup> | 99.4      | 99.6  | 99.5  |

<sup>1</sup> Households interviewed/households occupied

<sup>2</sup> Respondents interviewed/eligible respondents

## Key Findings

- **Electricity:** Nearly all households (more than 99%) have access to electricity.
- **Clean fuels and technology:** 20% of the population has access to clean fuels for cooking, heating, and lighting.
- **Indoor smoke:** 12% of households use solid materials for cooking, and 6% are exposed to smoking inside the home on a daily basis.
- **Household population and composition:** 39% of the population is under age 15. The average household size is 5.6 persons. Twenty percent of households are headed by women.
- **Birth registration:** 97% of children under age 5 have had their births registered with the civil authorities.
- **Educational attainment:** 67% of women and 56% of men have attained some secondary or completed secondary education. Sixteen percent of men and 8% of women have a higher or graduate education.
- **Child discipline:** 56% of children age 1–14 experienced at least one form of violent discipline in the month before the survey.

Information on the socioeconomic characteristics of the household population in the 2023 TjDHS provides a context for interpreting demographic and health indicators and furnishes an approximate indication of the representativeness of the survey. The information also sheds light on the living conditions of the population.

This chapter presents information on housing characteristics and household possessions, use of clean fuels and technologies (related to cooking, heating, and lighting), wealth, household population and composition, labor migration, household remittances, children’s living arrangements and orphanhood, birth registration, child discipline, educational attainment, and school attendance.

## 2.1 HOUSING CHARACTERISTICS

The 2023 TjDHS collected information on access to electricity, flooring materials, and the number of rooms used for sleeping (**Table 2.1**). Nearly all households (more than 99%) in both urban and rural areas have access to electricity. Half of household flooring materials are constructed from wood planks (28%) and parquet or polished wood (22%), with this proportion nearly twice as high in urban areas (69%) as in rural areas (42%). More rural than urban households use cement flooring (26% versus 9%). The vast majority of households use two or more rooms for sleeping (89%), with 48% of urban households using two rooms for sleeping and 49% of rural households using three or more rooms for sleeping. Eight percent of urban households and 5% of rural households are exposed to smoking inside the home on a daily basis; 87% of households are not exposed to smoking inside the home.

### 2.1.1 Use of Clean Fuels and Technologies

#### Primary reliance on clean fuels and technologies

The percentage of the population using clean fuels and technologies for cooking, heating, and lighting, where each component is defined as follows:

- **Clean cooking fuels and technologies**  
Includes stoves/cookers using electricity and liquefied petroleum gas (LPG)/natural gas/biogas
- **Clean heating fuels and technologies**  
Includes central heating, thermo-electro-central, electricity, and LPG/natural gas/biogas
- **Clean lighting fuels and technologies**  
Includes electricity, solar lanterns, and battery-powered or rechargeable flashlights/torches/lanterns

**Sample:** Households and de jure population

### 2.1.2 Cooking

In three quarters of households (75%), cooking takes place outside the home; however, this proportion is nearly twice as high in rural households (88%) as in urban households (45%) (**Table 2.2**). In comparison, 54% of urban households and only 8% of rural households cook inside the home.

Overall, 88% of households use clean fuels and technologies for cooking (98% of urban households and 84% of rural households). Eighty-six percent of the de jure population lives in households that use clean fuels and technologies for cooking, including 97% of the urban de jure population and 82% of the rural population. The main technologies used are electric stoves (50% of households) and LPG/natural gas stoves (34%). Twelve percent of households use solid fuels for cooking, with this proportion being much high in rural households (16%) than in urban households (2%). The most commonly used solid fuel is wood (8%), followed by animal dung (3%) (**Table 2.2**).

### 2.1.3 Heating and Lighting

The majority of de jure residents (76%) use a traditional cookstove for heating, while 12% use a manufactured space heater and 5% use central heating (**Table 2.3**). However, there is a great deal of variation between the urban and rural populations. Ninety-one percent of the de jure rural population uses a traditional cookstove for heating, as compared with only 33% of the urban population; conversely, 38% of the de jure urban population uses a manufactured space heater for heating, compared with only 3% of the rural population.

Overall, only 20% of the de jure population uses clean fuels and technologies for heating (63% of the urban population and 5% of the rural population), with the most commonly used clean fuel being electricity (14%). Forty-three percent of de jure residents use coal/lignite for heating fuel, while 25% use wood. Higher proportions of rural than urban residents use these fuels. The vast majority of the population uses clean fuels for lighting (more than 99%), with 99% using electricity (**Table 2.3**).

### 2.1.4 Primary Reliance on Clean Fuels and Technologies

Overall, 20% of the de jure population relies primarily on clean fuels and technologies for cooking, space heating, and lighting. Eighty-six percent of the population relies on clean fuels for cooking, 20% for heating, and more than 99% for lighting (**Table 2.4**).

## Patterns by background characteristics

- Primary reliance on clean fuels and technologies for cooking, space heating, and lighting is much more common in urban areas (63%) than in rural areas (4%) (**Figure 2.1**).
- The percentage of the de jure population that relies on clean fuels and technologies for cooking, space heating, and lighting is over five times higher in Dushanbe (88%) than in Sughd, the region with the next highest percentage (17%).
- Primary reliance on clean fuels and technologies for cooking, space heating, and lighting is highest among the population in the highest wealth quintile (85%) and lowest among the population in the lowest wealth quintile (1%).

**Figure 2.1 Primary reliance on clean fuels and technologies by residence**

Percentage of de jure population relying on clean fuels and technologies for:

## 2.2 HOUSEHOLD WEALTH

### 2.2.1 Household Durable Goods

The survey also collected information on household effects, means of transportation, and ownership of agricultural land and farm animals (**Table 2.5**). Televisions and mobile phones are the most common information and communication devices in Tajikistan. Almost all households have mobile phones (96%) and a television (98%). Almost one in five (17%) households own a computer (30% of urban households and 11% of rural households).

Bicycles (44%) and cars/trucks (41%) are the most common means of transportation owned by households, with bicycles being the most prevalent form of transportation in rural households (50%) and cars/trucks being the most prevalent form in urban households (36%). However, rural households are more likely than urban households to own both a bicycle (50% versus 31%) and a car or truck (43% versus 36%). Seventeen percent of households own an animal-drawn cart, and 5% own a motorcycle or scooter.

Use of agricultural land and ownership of farm animals vary greatly between urban and rural areas: 54% of rural households and 10% of urban households use agricultural land, and 61% of rural households and 12% of urban households own farm animals (**Table 2.5**).

### 2.2.2 Wealth Index

#### Wealth index

Households are given scores based on the number and kinds of consumer goods they own, ranging from a television to a bicycle or car, and housing characteristics such as source of drinking water, toilet facilities, and flooring materials. These scores are derived using principal component analysis. National wealth quintiles are compiled by assigning the household score to each usual (de jure) household member, ranking each person in the household population by her or his score, and then dividing the distribution into five equal categories, each comprising 20% of the population.

**Sample:** Households

**Table 2.6** shows the distribution of the de jure household population by wealth quintile according to residence and region. Wealth is clearly concentrated in urban areas. Sixty-five percent of the urban population falls in the highest wealth quintile. By contrast, 50% of the rural population falls in the two lowest wealth quintiles (**Figure 2.2**). Wealth varies widely by region. Ninety-one percent of the population in Dushanbe falls in the highest wealth quintile, as compared with only 7% of the population in Khatlon. Conversely, 36% of the population in Gorno-Badakhshan Autonomous Oblast (GBAO) falls in the lowest wealth quintile, compared with less than 1% of the population in Dushanbe.

**Figure 2.2 Household wealth by residence**

**Table 2.6** also includes the Gini coefficient, a measure of the level of concentration of wealth. The Gini coefficient ranges from 0–1, with 0 being an equal wealth distribution and 1 being a totally unequal distribution. The Gini coefficient is 0.32 at the national level, which suggests that wealth is somewhat unevenly distributed across the population. Wealth is distributed more evenly in the rural population than in the urban population (0.19 versus 0.25).

## 2.3 HOUSEHOLD POPULATION AND COMPOSITION

### Household

A person or group of related or unrelated persons who live together in the same dwelling unit(s), who acknowledge one adult male or female as the head of the household, who share the same housekeeping arrangements, and who are considered a single unit.

### De facto population

All persons who stayed in the selected households the night before the interview (whether usual residents or visitors).

### De jure population

All persons who are usual residents of the selected households, whether or not they stayed in the household the night before the interview.

### How data are calculated

All tables are based on the de facto population unless otherwise specified.

The de facto survey population (those who stayed overnight in the surveyed households) is 42,221; 53% of these individuals are female and 47% are male. Nearly half (47%) of the population is under age 20, over one-third is under age 15 (39%), and only 5% is age 65 and older. Children under age 5 and adolescents age 10–19 account for 13% and 21% of the population, respectively (**Table 2.7** and **Figure 2.3**).

The population pyramid in **Figure 2.3** shows the population distribution by 5-year age groups, separately for males and females.

The broad base of the pyramid is typical of populations that have experienced high fertility in the recent past.

The average household size is 5.6 people (**Table 2.8**). Rural households are larger (5.9 people per household) than urban households (4.9 people per household). Men head the majority of households, with only 20% headed by women.

Five percent of households have foster and/or orphan children, with this percentage higher in urban areas than in rural areas (7% and 5%, respectively).

**Trends:** The age-sex structure of the Tajikistan population has shown little change over the past decade. The percentage of children under age 15 is 39% in 2023 (**Table 2.7**), nearly the same as in 2012 and 2017 (38% each). The proportion of youth between age 15 and age 24 has decreased over time, from 20% in 2012 to 17% in 2017 and 15% in 2023. The population age 65 or older has changed little over the past decade (4% in 2012 and 5% in 2023). The average household size declined from 6.3 persons in 2012 and 6.0 persons in 2017 to 5.6 persons in 2023.

The percentage of households that have foster and/or orphan children has decreased over time, from 8% of households in 2012 to 5% in 2023 (**Table 2.8**).

## 2.4 CHILDREN'S LIVING ARRANGEMENTS AND PARENTAL SURVIVAL

### Orphan

A child with one or both parents who are dead.

**Sample:** Children under age 18

Eighty-nine percent of de jure children under age 18 live with both of their parents; 2% are not living with their biological parents. Two percent of children under age 18 are orphans (one or both parents are dead), with most having lost their father (2%). Orphanhood increases with the child's age, from 1% among children age 0–4 to 5% among children age 15–17 (**Table 2.9**). By region, orphanhood is higher in Dushanbe and GBAO (3% each) than in the other regions (2%).

**Trends:** The proportion of children who are orphaned has fallen slightly over time, from 3% in 2012 to 2% in 2023.

**Figure 2.3 Population pyramid**

*Percent distribution of the household population*

## 2.5 BIRTH REGISTRATION

### Registered birth

Child has a birth certificate or child does not have a birth certificate, but the birth is registered with the civil authorities.

**Sample:** De jure children under age 5

The global concern regarding the need to have all births registered by 2030 is evident in SDG Targets 16.9.1 and 17.19.2. Birth registration is important because a child who is not registered is in danger of being denied the right to an official identity, a recognized name, and a nationality.

Respondents were asked whether they had birth certificates for the children in the household who were under age 5. If a child did not have a birth certificate, respondents were asked whether the birth had been registered with the civil authorities. **Table 2.10** presents information on the percentage of children under age 5 who have a birth certificate and the percentage who do not have a birth certificate but whose birth has been registered with the civil authorities. Overall, 97% of children under age 5 had their births registered with the civil authorities; this includes 94% with a birth certificate and 3% whose birth was registered but who do not have a birth certificate. The percentage of births that have been registered increases from 92% among children younger than age 1 to 98% among children age 1–4. By region, birth registration ranges from 94% in Districts of Republican Subordination (DRS) to 98% in Sughd and GBAO (**Map 2.1**).

**Map 2.1 Birth registration by region**

*Percentage of de jure children under age 5 whose births are registered with the civil authorities*

**Trends:** The percentage of children whose births are registered has increased over time, from 82% in 2012 to 96% in 2017 and 97% in 2023. Similarly, the percentage of children with a birth certificate increased from 82% in 2012 to 91% in 2017 and 94% in 2023.

## 2.6 EDUCATION

### 2.6.1 Educational Attainment

#### Median educational attainment

Half of the population has completed less than the median number of years of schooling, and half of the population has completed more than the median number of years of schooling.

**Sample:** De facto household population age 6 and older

**Table 2.11.1** and **Table 2.11.2** present data on the educational attainment of the female population and male population age 6 and older, respectively.

Sixty-seven percent of the female population and 56% of the male population age 6 and older have attained some secondary or completed secondary education. Males are more likely than females to have a postsecondary education (22% versus 14%). Only 6% of males and females age 6 and older never attended school. Sixteen percent of males have a higher education (the equivalent of a university degree), as compared with 8% of females. Median years of schooling are 9.0 among females and 9.4 among males.

**Trends:** The percentage of respondents who have completed secondary education has increased slightly since 2012, from 33% to 36% among females and from 30% to 33% among males. The percentage of respondents with a postsecondary education (professional primary, professional middle, higher, and postgraduate levels combined) has increased slightly over time among females, from 10% in 2012 to 13% in 2017 and 14% in 2023, and has changed only minimally among males (23% in 2012, 25% in 2017, and 22% in 2023). The percentage of respondents with a higher education increased from 5% in 2012 to 8% in 2023 among females and from 15% in 2012 to 16% in 2023 among males.

The median number of years of schooling among females has increased slightly over the past decade, from 8.6 in 2012 to 9.0 years in 2023. During the same period, the median among males has changed only minimally (9.3 in 2012, 9.5 in 2017, and 9.4 in 2023).

#### Patterns by background characteristics

- The median number of years of schooling is higher in urban areas than in rural areas among both females (9.3 versus 9.0) and males (9.8 versus 9.3).
- On average, educational attainment is highest in GBAO and lowest in DRS. The difference in median years of schooling between GBAO and DRS is 1.5 among females and 1.1 among males.
- Dushanbe lags behind GBAO in median years of schooling among both males and females; however, the percentage of respondents attaining a higher education is higher in Dushanbe than in any of the other regions, especially among males. Overall, 35% of men and 20% of women from Dushanbe attained a higher education, as compared with 13% of men and 6% of women in Khatlon, indicating clear educational advantages for people living in Dushanbe over people from the other regions.
- Wealth has a strong positive relationship with education. Median years of schooling vary from 8.5 in the lowest wealth quintile to 9.6 in the highest quintile among females and from 8.9 in the lowest wealth quintile to 10.1 in the highest quintile among males, indicating more than a 1-year difference in the median number of years of schooling between the populations from these opposite quintiles.

## 2.6.2 Primary and Secondary School Attendance

### Net attendance ratio (NAR)

Percentage of the school-age population that attends primary or secondary school.

**Sample:** Children age 7–10 for primary school NAR and children age 11–17 for secondary school NAR

### Gross attendance ratio (GAR)

The total number of children attending primary school divided by the official primary school-age population and the total number of children attending secondary school divided by the official secondary school-age population.

**Sample:** Children age 7–10 for primary school GAR and children age 11–17 for secondary school GAR

The results in **Table 2.12** show that school attendance is high but not universal among the school-age population in Tajikistan. The primary school NAR indicates that 88% of children age 7–10 who should be attending the primary level are doing so. Similarly, the secondary school NAR shows that 88% of children age 11–17 who should be attending the secondary level are doing so. The NAR for primary school is the same for girls and boys (88%), while the secondary school NAR is slightly higher among boys (90%) than girls (86%).

The primary school gross attendance ratio (GAR) for children age 7–10 is 97% (96% for girls and 97% for boys). The secondary school GAR for children age 11–17 is 98%, and the ratio is higher for boys (more than 99%) than for girls (96%).

### Gender parity index (GPI)

The ratio of female to male students attending primary school and the ratio of female to male students attending secondary school. The index reflects the magnitude of the gender gap.

**Sample:** Primary school students and secondary school students

### Out-of-school rate

Percentage of the school-age population that is not attending any level of education.

**Sample:** Children age 7–10 for primary school out-of-school rate and children age 11–17 for secondary school out-of-school rate

In addition, **Table 2.12** shows the percentage of children of primary and secondary school age who are out of school. The out-of-school rate for primary school is the percentage of the primary school-age (7–10 years) population that is not attending any level of education. The out-of-school rate for secondary school is the percentage of the secondary school-age (11–17 years) population that is not attending any level of education. The out-of-school rate is 7% for primary school and 6% for secondary school.

**Table 2.12** also presents information on the gender parity index (GPI). A GPI of 1 is evidence of equality in the net attendance ratio (NAR) for girls to boys. The primary school GPI is 0.99, indicating that boys have only a very slight advantage over girls in primary school attendance. The secondary level GPI is 0.97, showing that boys have a greater but still comparatively small advantage over girls in secondary school attendance.

### School completion rate

Percentage of the school-age population that is not attending any level of education.

**Sample:** Children age 13–15 for primary school, young people age 18–20 for lower secondary school, and young people age 20–22 for upper secondary school

In Tajikistan, an 11-year system of general education is currently in place, and children enter primary school at age 7. Primary education encompasses 4 years (grades 1–4, age 7–10), lower secondary (also known as general basic) encompasses 5 years (grades 5–9, age 11–15), and upper secondary encompasses 2 years (grades 10–11, age 16–17). The school year typically runs from September of one year to May or June of the following year. Secondary education is compulsory until the ninth grade.

The primary education completion rate shown in **Table 2.13** represents the percentage of completion among a cohort of children 3 to 5 years older than the official age of the last grade of primary education (that is, the percentage of children who are age 13 to age 15) who completed primary education in Tajikistan. Completion rates are also presented for lower secondary and upper secondary education. Overall, 26% of children in Tajikistan completed the last grade of primary school, 28% completed the last grade of lower secondary school, and 39% completed the last grade of upper secondary school.

### Patterns by background characteristics

- The NAR for primary school is the same in urban and rural areas (88%). The secondary school NAR is higher in rural areas (87% among females and 91% among males) than in urban areas (84% among females and 89% among males).
- The primary school NAR is highest among girls in Dushanbe (90%). The secondary school NAR is lowest in Dushanbe (84% overall and 80% among girls). GBAO and Khatlon have the highest NARs for secondary school (90% each).
- The secondary school NAR is highest among male children from households in the second wealth quintile (93%) and female children from households in the third quintile (88%). Among both males and females, the NAR for secondary school is lowest in the highest wealth quintile (88% for males and 83% for females) (**Figure 2.4**).
- Out-of-school rates are slightly higher among females than among males; the difference is more pronounced for secondary school (8% among females and 5% among males). The percentage of secondary school-age children who do not attend any level of education is highest in DRS (9%) and is twice as high among the DRS female population (12%) as among the male population (6%).
- Completion rates for primary education show little variation by background characteristics. The completion rate for lower secondary school is highest among female students (30%), students in Dushanbe (31%), and those in the highest wealth quintile (32%) and lowest in GBAO (18%). The

**Figure 2.4 Secondary school attendance by household wealth**

completion rate for upper secondary school is notably higher in GBAO and Khatlon (41% each) than in Dushanbe (36%).

### 2.6.3 Participation Rate in Organized Learning among Children Age 6

#### **Participation rate in organized learning: adjusted net attendance ratio (NAR)**

Percentage of children 1 year younger than the official primary school entry age (at the beginning of the school year) who are attending an early childhood education program or primary school. The ratio is termed adjusted since it includes children in primary school.

**Sample:** Children age 6 at the beginning of the school year

**Table 2.14** presents data on participation in organized learning. Overall, only 4% of children 1 year younger than the official lower basic school entry age at the beginning of the school year have attended an early childhood education program, and 18% have attended primary school. The majority of children (78%) have attended neither an early childhood education program nor primary school. The adjusted NAR for organized learning among children age 6 at the beginning of the school year is 23%.

#### **Patterns by background characteristics**

- Early childhood education attendance is more common in urban areas (8%) than in rural areas (3%). Similarly, primary school attendance is more common in urban areas (22% versus 17%).
- Forty percent of children in GBAO attend an early childhood education program, as compared with less than 1% of children in Khatlon.
- The percentage of children who attend an early childhood education program increases with increasing household wealth, from 1% in the lowest wealth quintile to 10% in the highest wealth quintile.
- The adjusted NAR for organized learning is highest in GBAO (72%) and Dushanbe (41%) and lowest in Feed the Future (FTF) districts and Khatlon (18% each).

## 2.7 CHILD DISCIPLINE

#### **Nonviolent disciplinary approaches**

Includes one or more of the following:

- Taking away privileges, forbidding something the child liked, or not allowing the child to leave the house
- Explaining that the child's behavior was wrong
- Giving the child something else to do

**Sample:** De jure children age 1–14

#### **Psychological aggression**

Includes one or both of the following:

- Shouting, yelling, or screaming at the child
- Calling the child dumb, lazy, or a similar term

**Sample:** De jure children age 1–14

### Physical punishment

Includes one or more of the following:

- Shaking the child
- Spanking, hitting, or slapping the child on the bottom with a bare hand
- Hitting the child on the bottom or other part of the body with a belt, hairbrush, stick, or other similar hard object
- Hitting or slapping the child on the face, head, or ears
- Hitting the child on the hand, arm, or leg
- Beating the child up, that is, hitting the child over and over as hard as one can

**Sample:** De jure children age 1–14

### Severe physical punishment

Includes one or both of the following:

- Hitting or slapping the child on the face, head, or ears
- Beating the child up, that is, hitting the child over and over as hard as one can

**Sample:** De jure children age 1–14

The way parents and caretakers discipline children can have long-term consequences for their physical and psychological development and well-being. To identify the types of child disciplinary methods used in Tajikistan, questions on child discipline were asked about one randomly selected child age 1–14 in each household.<sup>1</sup> In the 2023 TjDHS, the respondent to the Household Questionnaire (the household head or other knowledgeable adult household member) was asked a series of separate questions about practices used to discipline the child during the month before the survey.

Overall, 56% of children age 1–14 experienced any type of violent discipline in the month before the survey (**Table 2.15**). Over half of children (54%) experienced psychological aggression, and a little over one-third (38%) experienced only nonviolent discipline. Thirty-four percent of children experienced at least one form of physical punishment, and 6% experienced severe physical punishment. Overall, only 4% of respondents administered questions about child discipline believe that a child needs physical punishment to be raised or educated properly (**Table 2.16**).

**Trends:** The percentage of children age 1–14 who experienced any form of physical violence in the past month decreased from 69% in 2017 to 56% in 2023. Over the same period, the percentage of respondents who believe that physical punishment is needed to raise or educate a child properly decreased from 15% to 4%.

### Patterns by background characteristics

- Boys are more likely than girls to have experienced at least one form of violent discipline (58% versus 54%) and to have experienced severe physical punishment (7% versus 5%).
- Over half of children age 3–14 experienced violent discipline in the past month. Children in the 5–9 age group experienced the highest frequencies of any form of violent discipline (59%), psychological aggression (57%), and severe physical punishment (7%).

<sup>1</sup> If several children age 1–14 were listed in the household schedule, only one child per household was randomly selected for administration of the questions on child discipline. If one child age 1–14 was listed in the household schedule, the questions on child discipline were administered about this child. If none of the children listed in the household schedule were age 1–14, the questions on child discipline were not administered.

- The percentage of children experiencing violent discipline was highest in DRS (63%) and Khatlon (61%) and lowest in Sughd (43%). The reported frequency of violent discipline in the past month was the same in rural and urban areas (56%).
- Children from the poorest households (65%) and those born to mothers with a general basic education (63%) experienced higher levels of exposure to violent discipline, mostly in the form of psychological aggression, than children from wealthier households and those born to mothers in other education categories.
- The percentage of respondents who believe that physical punishment is needed to raise or educate a child properly is lowest in GBAO (less than 1%) and highest in DRS (8%).

## 2.8 LABOR MIGRATION AND HOUSEHOLD REMITTANCES

According to the International Organization for Migration (IOM), “for the past two decades, Tajikistan has been experiencing a large-scale outflow of labor migration, with the majority traveling to the Russian Federation seeking employment” (IOM 2024). Personal remittances received by households from labor migrants contributed to over 38% of the country’s gross domestic product (GDP) in 2023 (World Bank 2024). The outflow of labor migration from Tajikistan to Russia (the largest country of destination) is mostly seasonal and slowing down due to stricter regulations and sanctions that bring uncertainty about the sustainability of strong dependence on personal remittances in the future (IOM 2024; Lemon 2019).

The 2023 TjDHS collected information on labor migration and receipt of money from abroad. Thirty-eight percent of households reported having a labor migrant who had worked abroad for 3 or more months in the past 12 months, and 38% of households also reported receiving money or parcels from abroad. Among these households, the vast majority (97%) reported that labor migrants were working in Russia and the same percentage reported receiving money or parcels from Russia. These data corroborate data from other surveys on labor migration (Lemon 2019). Women and men are equally likely to have worked abroad in the past 12 months; the median number of men and women who worked abroad in the past 12 months is 1.7 per household (**Table 2.17** and **Table 2.18**).

Among the 3,040 households that received money or parcels from abroad, 52% reported that their financial situation improved slightly as a result, while 43% reported substantial financial improvement and 3% reported no change (**Table 2.19**).

### Patterns by background characteristics

- Forty-three percent of rural households reported having a labor migrant who worked abroad for at least 3 months in the past year, as compared with 27% of urban households.
- The percentage of households that reported having a labor migrant who worked abroad for at least 3 months in the past year is highest in GBAO (53%) and lowest in Dushanbe (22%).
- Fifty percent of households in DRS that received money or parcels from abroad reported a substantial impact on their financial situation, compared with only 26% in Dushanbe. Seventy-one percent of households in GBAO reported a slight improvement in their financial situation as a result of receiving money from abroad.

## LIST OF TABLES

For more information on household population and housing characteristics, see the following tables:

- **Table 2.1      Household characteristics: Housing**
- **Table 2.2      Household characteristics: Cooking**
- **Table 2.3      Household characteristics: Heating and lighting**
- **Table 2.4      Primary reliance on clean fuels and technologies**

LPG = Liquefied petroleum gas

<sup>1</sup> Includes manufactured solid fuel stoves with and without a chimney

<sup>2</sup> Includes stoves/cookers using electricity and LPG/natural gas/biogas

<sup>3</sup> Includes coal/lignite, charcoal, straw/shrubs/grass, and garbage/plastic

**Table 2.3 Household characteristics: Heating and lighting**

<sup>1</sup> Includes central heating, thermo-electro-central, air conditioner winter-summer, electricity, piped natural gas, liquefied petroleum gas (LPG)/cooking gas, and biogas

<sup>2</sup> Includes piped natural gas, LPG/cooking gas, and biogas

<sup>3</sup> Includes straw/shrubs/grass, agricultural crop, sawdust, and any other fuels mentioned by the respondent

<sup>4</sup> Includes kerosene lamps, charcoal, agricultural crop, animal dung/waste, and other lighting fuels or technologies mentioned by the respondent

**Table 2.4 Primary reliance on clean fuels and technologies**

Percentage of de jure population relying on clean fuels and technologies for cooking, percentage relying on solid fuels for cooking, percentage relying on clean fuels and technologies for space heating, percentage relying on clean fuels and technologies for lighting, and percentage relying on clean fuels and technologies for cooking, space heating, and lighting, according to background characteristics, Tajikistan DHS 2023

| Background characteristic | Primary reliance on clean fuels and technologies for cooking <sup>1</sup> | Primary reliance on solid fuels for cooking <sup>2</sup> | Number of persons in households that reported cooking | Primary reliance on clean fuels and technologies for space heating <sup>3</sup> | Number of persons in households that reported use of space heating | Primary reliance on clean fuels and technologies for lighting <sup>4</sup> | Number of persons in households that reported use of lighting | Primary reliance on clean fuels and technologies for cooking, space heating, and lighting <sup>5</sup> | Number of persons |

| Number of households                                                                                              | 2,393     | 5,642 | 8,035 |

Note: Table is based on de jure household members, i.e., usual residents.

<sup>1</sup> Includes children with one dead parent and an unknown survival status of the other parent

<sup>2</sup> Children not living with a biological parent are those under age 18 living in households with neither their mother nor their father present.

**Table 2.9 Children's living arrangements and orphanhood**

Percent distribution of de jure children under age 18 by living arrangements and survival status of parents, percentage of children not living with a biological parent, and percentage of children with one or both parents dead, according to background characteristics, Tajikistan DHS 2023

| Background characteristic | Living with mother but not with father |              | Living with father but not with mother |              | Not living with either parent |            |                   |                   |           |                                      | Total | Percent-age not living with a biological parent | Percent-age with one or both parents dead <sup>1</sup> | Number of children |
|---------------------------|----------------------------------------|--------------|----------------------------------------|--------------|-------------------------------|------------|-------------------|-------------------|-----------|--------------------------------------|-------|-------------------------------------------------|--------------------------------------------------------|--------------------|
|                           | Living with both parents               | Father alive | Father dead                            | Mother alive | Mother dead                   | Both alive | Only mother alive | Only father alive | Both dead | Missing information on father/mother |       |                                                 |                                                        |                    |

<sup>1</sup> Completed grade 4 at the primary level

<sup>2</sup> Attended or completed the general basic level (grades 5–9) and attended but did not complete the general secondary level (grades 10–11)

<sup>3</sup> Completed grade 11 at the secondary level or completed grade 10 at the secondary level and has a general education school diploma

**Table 2.12 School attendance ratios**

Net attendance ratios (NAR), gross attendance ratios (GAR), and out-of-school rates for the de facto household population by sex and level of schooling, and the gender parity index (GPI), according to background characteristics, Tajikistan DHS 2023

| Background characteristic | Net attendance ratio <sup>1</sup> |        |       |                                  | Out-of-school rate <sup>2</sup> |        |       | Gross attendance ratio <sup>3</sup> |        |       |                                  |

<sup>1</sup> The NAR for primary school is the percentage of the primary school-age (7–10 years) population that is attending primary school. The NAR for secondary school is the percentage of the secondary school-age (11–17 years) population that is attending secondary school. By definition, the NAR cannot exceed 100.0.

<sup>2</sup> The out-of-school rate for primary school is the percentage of the primary school-age (7–10 years) population that is not attending any level of education. The out-of-school rate for secondary school is the percentage of the secondary school-age (11–17 years) population that is not attending any level of education.

<sup>3</sup> The GAR for primary school is the total number of primary school students, expressed as a percentage of the official primary school-age population. The GAR for secondary school is the total number of secondary school students, expressed as a percentage of the official secondary school-age population. If there are significant numbers of overage and underage students at a given level of schooling, the GAR can exceed 100.0.

<sup>4</sup> The gender parity index for primary school is the ratio of the primary school NAR (GAR) for females to the NAR (GAR) for males. The gender parity index for secondary school is the ratio of the secondary school NAR (GAR) for females to the NAR (GAR) for males.

**Table 2.13 School completion rates**

Completion rates for the de facto household population by level of schooling, according to background characteristics, Tajikistan DHS 2023

| Background characteristic | Primary school completion rate <sup>1</sup> | Number of children age 13–15 at the beginning of the school year <sup>2</sup> | Lower secondary school completion rate <sup>1</sup> | Number of young people age 18–20 at the beginning of the school year <sup>2</sup> | Upper secondary school completion rate <sup>1</sup> | Number of young people age 20–22 at the beginning of the school year <sup>2</sup> |

<sup>1</sup> The primary school completion rate is the percentage of children 3–5 years older than the intended age for the last grade of primary school who completed the last grade. The lower secondary school completion rate is the percentage of adolescents 3–5 years older than the intended age for the last grade of lower secondary school who completed the last grade. The upper secondary school completion rate is the percentage of youth 3–5 years older than the intended age for the last grade of upper secondary school who completed the last grade.

<sup>2</sup> The total number of children, adolescents, and youth 3–5 years older than the intended age for the last grade for primary, lower, and upper secondary school, respectively

**Table 2.14 Participation rate in organized learning**

Percent distribution of children 1 year younger than the official primary school entry age at the beginning of the school year by attendance at an early childhood education program or primary school, and the adjusted net attendance ratio (NAR), according to background characteristics, Tajikistan DHS 2023

| Background characteristic | Percent distribution of children attending |                |                                                                 | Total | Adjusted NAR <sup>1</sup> | Number of children age 6 at the beginning of the school year |

Note: An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> The denominator is respondents to the Household Questionnaire living in households where a child age 1–14 was randomly selected for the child discipline module.

**Table 2.17 Labor migration**

Percentage of households with members working abroad in the past 12 months for 3 or more months; among households with members working abroad, percent distribution by the most recent country of work; and median numbers of women and men who worked abroad, according to background characteristics, Tajikistan DHS 2023

## CHARACTERISTICS OF RESPONDENTS

### Key Findings

- **Education and literacy:** 20% of women have completed higher than a secondary education, and 96% are literate.
- **Exposure to mass media:** 44% of women have used the internet in the past month. Television is the most commonly accessed form of weekly media (66%).
- **Employment:** 22% of women are currently employed, a decrease from 2017.
- **Occupation:** Nearly one in four employed women work in agriculture, and one in five work in professional/technical/managerial roles.
- **Place of birth:** 85% of women in Tajikistan have always lived in their current place of residence.
- **Diabetes and hypertension:** 13% of women have been told by a health care provider that they have high blood pressure or hypertension and 2% that they have high blood sugar or diabetes.

This chapter presents information on the demographic and socioeconomic characteristics of the survey respondents such as age, education, literacy, marital status, employment, occupation, wealth, residence at birth, current place of residence, and recent migration. The chapter also presents information on respondents' use of tobacco and alcohol and whether they have had their blood pressure and blood sugar measured and whether they have been diagnosed with hypertension and diabetes. Together, this information is useful for understanding the factors that affect use of reproductive health services, contraceptive use, and other health behaviors.

### 3.1 BASIC CHARACTERISTICS OF SURVEY RESPONDENTS

The 2023 TjDHS interviewed 9,879 women age 15–49 (**Table 3.1**). Three quarters of women (75%) are currently married or living together with a man as though married, while 20% of women have never been married. Five percent of women are divorced, separated, or widowed. Nearly three quarters of respondents (73%) live in rural areas. Approximately two-thirds live in either Khatlon (36%) or Sughd (28%), and 24% live in Districts of Republican Subordination (DRS). Dushanbe is home to 11% of the TjDHS respondents, and 2% live in Gorno-Badakhshan Autonomous Oblast (GBAO).

### 3.2 EDUCATION AND LITERACY

#### Literacy

Respondents who had attended higher than secondary school were assumed to be literate. All other respondents were considered literate if they could read aloud all or part of a sentence shown to them.

**Sample:** Women age 15–49

Educational attainment is high in Tajikistan. The majority of women age 15–49 (96%) have some secondary-level education or higher. Only 1% of respondents have no education at all, and 3% have attended only primary school (**Table 3.2**).

Over half of women in Tajikistan (60%) have completed a secondary or higher education (**Figure 3.1**). Eight percent of women have some professional primary or professional middle education, and 12% have a higher or graduate education. Women have completed a median of 10.2 years of schooling (**Table 3.2**).

The literacy rate is high (96%) among women in Tajikistan (**Table 3.3**). Only 3% of women cannot read at all.

**Figure 3.1 Education of survey respondents**

*Percent distribution of women age 15–49 by highest level of schooling attended or completed*

**Trends:** The median number of years of schooling completed by women age 15–49 has increased slightly since the 2012 and 2017 TjDHS surveys, from 9.4 years and 9.8 years, respectively, to 10.2 years. The proportion of women with no education has decreased slightly, from 2% in both 2012 and 2017 to 1% in 2023.

### Patterns by background characteristics

- Twenty-one percent of women in urban areas have attended or completed higher education, as compared with only 8% of those in rural areas.
- By region, the percentage of women with a secondary education or higher is lowest in DRS (43%) and highest in GBAO (80%) (**Map 3.1**).

**Map 3.1 Secondary or higher education by region**

*Percentage of women age 15–49 with completed secondary, professional primary/middle, or higher education*

- Women living in GBAO and Dushanbe are more likely to obtain a higher education (31% and 27%, respectively) than women living in the other regions (7–12%).
- Median number of years of schooling is lowest among women in DRS (8.8 years) and highest among women in GBAO (10.8 years).
- Women from the wealthiest households have completed a median of 10.5 years of schooling, while women from the poorest households have completed a median of 9.4 years.
- Women in Khatlon are four times as likely to be illiterate as women living in GBAO (4% and 1%, respectively).
- The percentage of women who are literate increases with increasing wealth, from 92% among those in the lowest wealth quintile to 99% among those in the highest quintile.

### 3.3 MASS MEDIA EXPOSURE AND INTERNET USAGE

#### Exposure to mass media

Respondents were asked how often they read a newspaper, listened to the radio, or watched television. Those who responded *at least once a week* are considered regularly exposed to that form of media.

**Sample:** Women age 15–49

#### Use of the internet

Respondents were asked if they have ever used the internet from any device, if they used the internet in the past 12 months, and, if so, how often they used it during the past month.

**Sample:** Women age 15–49

Data on women’s exposure to media are useful for understanding which women are likely to be reached by media campaigns disseminating family planning, health, and other information. Television is the form of media most commonly accessed at least weekly (66%) among women age 15–49 in Tajikistan (**Table 3.4**). Women have considerably less regular exposure to the other two forms of media: 19% read a newspaper at least once a week, while 9% listen to the radio at least once a week (**Table 3.4** and **Figure 3.2**). Nearly a third of women (31%) do not access any of the three forms of media at least once a week.

Less than half of women report having used the internet in the past 12 months (44%) (**Table 3.5**). Among women who have used the internet in the past 12 months, the majority used it almost every day (71%), while 22% used it at least once a week.

**Trends:** Weekly television exposure among women has decreased over the past 5 years, from 87% in 2017 to 66% in 2023. Radio exposure has remained low over the past decade but has also decreased slightly, from 14% in 2017 to 9% in 2023. Newspaper exposure, however, remained the same in 2023 as in 2017 (19%). The proportion of women with no access to any of these three forms of media in a given week nearly tripled during this period, from 12% to 31%, while the proportion with weekly access to all three forms of media fell from 8% to 5%. However, the proportion of women who reported using the internet in the past 12 months has almost quadrupled, from 12% to 44%.

**Figure 3.2 Exposure to mass media**

Percentage of women age 15–49 who are exposed to media on a weekly basis

## Patterns by background characteristics

- Women age 15–19 are more likely to read a newspaper once a week (34%) than women in the other age groups (14–18%).
- Urban women are twice as likely as rural women to access all three forms of media once a week (8% and 4%, respectively).
- One-third of rural women (33%) access none of the three forms of media in a given week, as compared with about one quarter (24%) of urban women.
- Exposure to the radio, television, and newspapers increases greatly with increasing education and household wealth.
- Urban women are more likely than rural women to have used the internet in the past 12 months (58% and 39%, respectively).
- Women in GBAO are nearly twice as likely as those in Khatlon to have used the internet in the past 12 months (66% and 34%, respectively).
- Internet use increases greatly with increasing household wealth and education and generally increases with age (Figure 3.3).

**Figure 3.3 Internet usage by education**

*Percentage of women age 15–49 who used the internet in the past 12 months*

## 3.4 EMPLOYMENT

### Currently employed

Respondents who were employed in the 7 days before the survey.

**Sample:** Women age 15–49

One in five women (22%) age 15–49 in Tajikistan are currently employed (Table 3.6). Only 2% of women who were employed in the 12 months preceding the survey are not currently employed. However, over three quarters (77%) of women were not employed in the 12 months preceding the survey.

**Trends:** The percentage of women who are currently employed has decreased over the past decade, from 27% in 2012 and 25% in 2017 to 22% in 2023. The percentage of women who have not worked in the past 12 months has increased during the same period, from 68% in 2012 to 75% in 2017 and 77% in 2023.

### Patterns by background characteristics

- Twenty-nine percent of women living in urban areas are currently employed, as compared with only 19% of those living in rural areas.
- The proportion of women who are currently employed is highest in GBAO (37%) and lowest in DRS (13%).
- The proportion of currently employed women increases steadily with increasing education, from 14% among those with no education or a primary education to 51% among those with a higher education (**Figure 3.4**).
- Similarly, the proportion of currently employed women increases from 16% among those in the lowest wealth quintile to 31% among those in the highest quintile.

**Figure 3.4 Employment status by education**

Percentage of women age 15–49 who are currently employed

## 3.5 OCCUPATION

### Occupation

Categorized as professional/technical/managerial, clerical, sales and services, skilled manual, unskilled manual, domestic service, agriculture, and other.

**Sample:** Women age 15–49 who were currently employed or had worked in the 12 months before the survey

Women who were employed in the 12 months preceding the survey were most likely to work in agriculture (24%); 22% were employed in professional, technical, or managerial positions, while 10% were employed in unskilled labor (**Table 3.7** and **Figure 3.5**). Among women who were employed in the 12 months preceding the survey, 81% are paid in cash only, and 5% are paid in cash and in-kind. Around 1 in 7 women are not paid (12%), and 2% receive only in-kind payments. Forty-five percent of women are employed by a nonrelative, 39% work for a family member, and 16% are self-employed (**Table 3.8**).

### Patterns by background characteristics

- Women age 15–19 are more likely to have worked in agriculture (50%) than women in older age groups (15–25%) and less likely to have worked in professional/technical/managerial occupations (5% versus 19–30%).

**Figure 3.5 Occupation**

Percentage of women age 15–49 employed in the 12 months before the survey by occupation

- Urban women (28%), women from GBAO (48%), women with a higher education (67%), and women in the highest wealth quintile (30%) are most likely to be employed in professional, technical, or managerial occupations.
- Agricultural employment is far more common among women in Sughd (38%) and Khatlon (26%) than among women in the other regions (6% or less).
- In general, the proportion of women working in professional/technical/managerial occupations increases with increasing education and household wealth.
- The proportion of women working in agriculture decreases with increasing household wealth.
- As expected, women who work in nonagricultural jobs are far more likely to be paid in cash for the work they do (93%) than women working in agricultural jobs (45%). Over one-third of women employed in agriculture are not paid at all for their work (37%).
- Women who work in agriculture are more likely to be employed by family members (53%) than to be employed by non-family members (37%) or to be self-employed (9%).

### 3.6 TOBACCO USE

The 2023 TjDHS included questions designed to assess the prevalence of tobacco use among women age 15–49. Tobacco use is rare among women in Tajikistan; only 2% reported that they regularly use tobacco (**Tables 3.9, 3.10, and 3.11**).

**Trends:** Tobacco use has been low among women in Tajikistan over the past decade (less than 1% in 2012 and 1% in 2017) but increased slightly to 2% in 2023.

### 3.7 ALCOHOL CONSUMPTION

The 2023 TjDHS included questions designed to assess the prevalence of alcohol consumption among women age 15–49. Alcohol consumption is very rare among women in Tajikistan; less than 1% reported consuming any alcohol in the past month (data not shown).

### 3.8 PLACE OF BIRTH AND RECENT MIGRATION

#### Recent migration

Percentage of respondents who were born outside of their current place of residence and moved to their current place of residence in the 5 years preceding the survey.

**Sample:** Women age 15–49 who were born outside of their current place of residence

The vast majority of women in Tajikistan (85%) have always lived in their current place of residence; only 14% were born in Tajikistan but outside of their current place of residence, and less than 1% were born outside of Tajikistan (**Table 3.12**). Among women who were born outside of their current place of residence, 25% moved to their current place of residence in the past 5 years.

#### Patterns by background characteristics

- Ninety-eight percent of women in GBAO have always lived in their current place of residence, as compared with 70% of women in Dushanbe.

- The proportion of women who have always lived in the same location decreases with increasing wealth. Conversely, the proportion of women who were born in Tajikistan but outside of their current residence increases with increasing wealth.
- The majority of women younger than age 25 (60% or more) who were born outside of their current place of residence moved there within the past 5 years.

### 3.8.1 Type of Migration

**Table 3.13** shows the type of migration among women who migrated to their current place of residence in the past 5 years. Thirty-one percent of migration is rural to rural, 27% is urban to urban, 26% is urban to rural, and 16% is rural to urban.

### 3.8.2 Reason for Migration

Women most commonly migrate because of marriage formation (70%), followed by family-related reasons (13%) (**Table 3.14**). Almost 1 in 10 women move due to forced displacement (8%). Employment (6%) and education or training (3%) are less common reasons for migration.

#### Patterns by background characteristics

- The proportion of women who migrate because of education is highest among those age 15–19 (22%).
- The vast majority of migration to rural areas is due to marriage formation: 90% of urban to rural migration and 78% of rural to rural migration are due to marriage formation.
- Migration due to employment is higher in the highest wealth quintile (16%) than in the other wealth quintiles (2% or less).
- The proportion of women who migrate because of marriage formation decreases with increasing wealth, from 88% among those in the lowest wealth quintile to 50% among those in the highest wealth quintile.

## 3.9 HISTORY OF HYPERTENSION AND DIABETES

### 3.9.1 History of Hypertension

High blood pressure, known as hypertension, is a chronic medical condition in which the force of the blood against the artery walls is high enough that it damages the artery walls, leading to health problems. Hypertension is a major risk factor for kidney disease and cardiovascular diseases such as stroke and ischemic heart disease.

In Tajikistan, 68% of women have ever had their blood pressure measured by a doctor or other health care worker. Thirteen percent reported that they have ever been told by a doctor or health care worker that they have high blood pressure or hypertension. Among women who have been told that they have high blood pressure or hypertension, 68% received that information in the past 3 years (**Table 3.15**).

#### Patterns by background characteristics

- The percentage of women whose blood pressure has ever been measured increases from 31% among those age 15–19 to over 70% among those in the older age groups. Similarly, the percentage of women who were told by a doctor or other health care worker that they have high blood pressure or hypertension increases from 2% among those age 15–19 to 23% among those age 45 and older.
- A higher percentage of women in urban areas (74%) than rural areas (66%) have had their blood pressure measured.

- The percentage of women whose blood pressure has ever been measured increases with increasing household wealth, from 56% in the lowest wealth quintile to 79% in the highest wealth quintile. Similarly, 10% of women in the lowest wealth quintile were told by a doctor or other health care worker that they have high blood pressure, as compared with 16% of women in the highest quintile.
- Testing of blood pressure is highest in Sughd (84%), and self-reported prevalence of high blood pressure is highest in Dushanbe (19%).

### 3.9.2 History of Diabetes

Diabetes mellitus is a metabolic disorder characterized by chronic hyperglycemia (raised blood sugar levels) that occurs because of defects in insulin secretion, insulin action, or both (Expert Committee on the Diagnosis and Classification of Diabetes Mellitus 1997).

In Tajikistan, 26% of women have ever had their blood sugar measured by a doctor or other health care worker. Overall, the percentage of women who reported that they have ever been told by a doctor or other health care worker that they have high blood sugar or diabetes is low (2%). Among women who have been told that they have high blood sugar or diabetes, 63% received that information in the past 3 years (**Table 3.16**).

#### Patterns by background characteristics

- The percentage of women whose blood sugar has ever been measured increases with increasing age, from 10% among those age 15–19 to 39% among those age 45 and older. Similarly, the percentage of women who were told by a doctor or other health care worker that they have high blood sugar or diabetes increases from 1% or less among those age 15–34 to 5% among those age 45 and older.
- A much higher percentage of women in urban areas (35%) than rural areas (23%) have had their blood sugar measured. The self-reported prevalence of diabetes is the same in urban and rural areas (2%).
- The percentage of women whose blood sugar has ever been measured increases with increasing household wealth (from 16% in the lowest wealth quintile to 40% in the highest wealth quintile), while the percentage of women who were told by a doctor or other health care worker that they have high blood sugar or diabetes is relatively consistent across wealth quintiles (1–2%).
- Testing of blood sugar and self-reported prevalence of high blood sugar/diabetes are higher in Dushanbe (51% and 3%, respectively) than in the other regions.

## LIST OF TABLES

Note: Respondents who are visitors in the household are excluded from this table. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> May include respondents who were born elsewhere in Tajikistan but moved to their current place of residence when very young

<sup>2</sup> Includes respondents who reported that they were born outside of Tajikistan but also declared that they always lived in their current place of residence. Such respondents are assumed not to have moved in the past 5 years.

**Table 3.13 Type of migration**

Percent distribution of women age 15–49 who moved to their current place of residence in the past 5 years by type of migration, according to age, Tajikistan DHS 2023

| Age          | Type of migration |                |                |                | Total | Number of respondents |
|--------------|-------------------|----------------|----------------|----------------|-------|-----------------------|

| <b>Total</b> | 27.3              | 25.7           | 15.9           | 31.1           | 100.0 | 366                   |

Note: Type of migration is based on categorizing the previous place of residence and the current place of residence as urban or rural. The previous place of residence is the place the person moved from just before moving to the current place of residence. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

**Table 3.14 Reason for migration**

Percent distribution of women age 15–49 who moved to their current place of residence by reason for migration, according to background characteristics, Tajikistan DHS 2023

Note: Respondents who are visitors in the household are excluded from this table. Respondents who stated that they were born outside of Tajikistan and that they have always lived in their current place of residence were not asked about the reason for migration and are excluded from this table. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Restricted to respondents who migrated within the past 5 years

**Table 3.15 History of hypertension**

Percentage of women age 15–49 who have ever had their blood pressure measured and percentage who have been told by a health care provider that they have high blood pressure or hypertension, and among women who have been told they have high blood pressure or hypertension, percentage told in the past 3 years they have high blood pressure or hypertension, according to background characteristics, Tajikistan DHS 2023

| Background characteristic       | Percentage of women who ever had their blood pressure measured by a doctor or other health care worker | Percentage of women who were ever told by a doctor or other health care worker that they have high blood pressure or hypertension | Number of women | Among women who have been told by a doctor or other health care worker that they have high blood pressure or hypertension: |                 |

Note: Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

## MARRIAGE AND SEXUAL ACTIVITY

### Key Findings

- **Marital status:** 75% of women age 15–49 are currently in union; 5% are divorced, widowed, or separated; and 20% have never been married.
- **Marriage registration:** 96% of women age 15–49 who are in union have registered their current marriage, and 95% have a marriage certificate.
- **Age at first marriage:** The median age at first marriage among women age 25–49 has stayed nearly the same during the past decade (20.2 years in 2012 and 2017 and 20.1 years in 2023).
- **Age at first sexual intercourse:** The median age at first sexual intercourse among women age 25–49 is 19.8 years, nearly the same as the median age at first marriage.

Marriage and sexual activity help determine the extent to which women are exposed to the risk of pregnancy. Thus, they are important determinants of fertility levels. The timing and circumstances of marriage and sexual activity, however, also have profound consequences for women's lives.

### 4.1 MARITAL STATUS

#### Currently in union

Women who report being married or living together with a partner as though married at the time of the survey. In this report, the terms currently in union and currently married are used interchangeably except where noted.

**Sample:** Women age 15–49

In Tajikistan, 75% of women age 15–49 are currently in union. Reflecting the traditional character of Tajik society, virtually all of these women are in formal unions; less than 1% report that they are living together as if married with a partner. One in five women (20%) have never been married, 4% are divorced or separated, and 1% are widowed (Table 4.1 and Figure 4.1).

Most Tajik women marry at least once during their lifetime. The percentage of women who have never been married decreases rapidly from 87% among women age 15–19 to 18% among women age 20–24. Only 2% of women age 40–44 have never been married. Women age 45–49 are most likely to be divorced or separated (6%) and to be widowed (5%).

**Figure 4.1 Marital status**

Percent distribution of women age 15–49

**Trends:** The percentage of women age 15–49 who have never been married has fallen over time, from 27% in 2012 to 22% in 2017 and 20% in 2023. Thus, as expected, the percentage of women who are currently married has increased over time, from 67% in 2012 to 72% in 2017 and 75% in 2023. Much of that change has been due to increases in the percentage of women age 20–24 who are currently in union (68% in 2012, 77% in 2017, and 79% in 2023).

## 4.2 MARRIAGE REGISTRATION

### Registered marriage

A woman whose marriage is registered with the civil authorities regardless of whether or not she has a marriage certificate.

**Sample:** Women age 15–49 who are currently in union

Ninety-six percent of women age 15–49 who are in union have registered their union, and 95% of in-union women have a marriage certificate for their current marriage (**Table 4.2**).

### Patterns by background characteristics

- The percentage of in-union women whose current marriage or union is registered is lowest among those age 15–19 (91%) and highest among those age 25–29 (97%).
- Marriage registration is highest in Gorno-Badakhshan Autonomous Oblast (GBAO) (99%) and lowest in Districts of Republican Subordination (DRS) (93%).

## 4.3 POLYGyny

### Polygyny

Women who report that their husband or partner has other wives are considered to be in a polygynous marriage.

**Sample:** Currently married women age 15–49

Polygynous unions are not common in Tajikistan. Overall, only 2% of women report that their husband (or partner) has other wives (**Table 4.3**). Almost all women in polygynous unions report that their husband has only one other wife.

**Trends:** The percentage of women age 15–49 with no other co-wives has increased over time, from 95% in 2017 to 97% in 2023.

### Patterns by background characteristics

- The percentage of women in polygynous unions increases with age, from less than 1% among those less than age 30 to 4% among those age 45–49.
- Women in Dushanbe (3%) are more likely than women in other regions to report that they have co-wives. Less than 1% of women in GBAO have co-wives, the lowest percentage of all regions.

## 4.4 AGE AT FIRST MARRIAGE

### Median age at first marriage

Age by which half of respondents have been married.

**Sample:** Women age 25–49

**Table 4.4** shows that 1% of women age 25–49 in Tajikistan were married by age 15, and 14% were married by age 18. The percentage of women who are married increases rapidly after age 18, with 49% of women married by age 20, 71% married by age 22, and 86% married by age 25 (**Figure 4.3**). Only 3% of women age 25–49 have never been married. The median age of marriage among women age 25–49 is 20.1 years (**Table 4.5** and **Figure 4.2**).

**Trends:** The median age at first marriage among women age 25–49 has stayed essentially the same over the past decade (20.2 years in 2012 and 2017 and 20.1 years in 2023).

#### Patterns by background characteristics

- The median age at first marriage is highest in GBAO (23.4 years) and lowest in Sughd (19.8 years).
- The median age at first marriage is approximately 2 years higher among women with a higher education (21.7 years) than among those with a general basic education (19.8 years) and a general secondary education (19.9 years).
- The median age at first marriage varies by less than 1 year across all wealth quintiles, ranging from 19.8 years in the fourth quintile to 20.4 years in the highest quintile.

**Figure 4.2 Median age at first sex and first marriage**

**Figure 4.3 Percentage of women married by exact age**

## 4.5 AGE AT FIRST SEXUAL INTERCOURSE

### Median age at first sexual intercourse

Age by which half of respondents have had sexual intercourse.

**Sample:** Women age 20–49 and 25–49

The median age at first sexual intercourse among women age 25–49 is 19.8 years (**Figure 4.2**). This is very close to the median age at first marriage among women age 25–49 (20.1 years). Less than 1% of women age 25–49 have had sexual intercourse by age 15 (**Table 4.6**), while 11% have had intercourse by age 18. These percentages are nearly identical among women age 20–49.

**Trends:** The percentage of women age 20–49 who first had sexual intercourse by age 20 has increased over time, from 45% in 2012 to 49% in 2017 and 54% in 2023.

## 4.6 RECENT SEXUAL ACTIVITY

**Table 4.7** shows that 81% of women age 15–49 have ever had sexual intercourse, and 51% had sex during the 4 weeks before the survey.

Marital status is closely related to sexual activity. Most currently married women (93%) had sex within the year before the survey, and 51% had sex within the 4 weeks before the survey. The opposite pattern is observed among women who were divorced, separated, or widowed, 87% of whom had not had sex during the year before the survey. Only 3% of never-married women had ever had sex, and most of those women reported that they most recently had sex 1 or more years before the survey.

### Patterns by background characteristics

- The percentage of women who reported having sexual intercourse within the 4 weeks before the survey is slightly higher in urban areas (52%) than in rural areas (50%).
- The percentage of women who had sexual intercourse within the past 4 weeks is highest in DRS (53%) and lowest in Sughd (49%).
- Twenty-five percent of women with a general basic education have never had sexual intercourse, as compared with 12% of those with no education or a primary education.

### LIST OF TABLES

Note: The age at first marriage is defined as the age at which the respondent began living with her first spouse/partner.

na = not applicable due to censoring

a = omitted because less than 50% of the women began living with their spouse or partner for the first time before reaching the beginning of the age group

<sup>1</sup> Excludes women who had sexual intercourse within the past 4 weeks

<sup>2</sup> Excludes women who are not currently married

### Key Findings

- **Total fertility rate (TFR):** The TFR in Tajikistan is 3.5 children per woman.
- **Birth intervals:** In Tajikistan, the median interval between births is 32.6 months.
- **Teenage pregnancy:** Among women age 15–19, 7% have ever been pregnant, 3% have ever had a live birth, and less than 1% reported experiencing a pregnancy loss (stillbirth, miscarriage, or abortion).
- **Pregnancy outcomes:** 83% of pregnancies ending in the 3 years preceding the survey resulted in live births, 12% were miscarriages, 1% were stillbirths, and 4% were induced abortions.
- **Induced abortions:** 5% of women age 15–49 in Tajikistan reported having at least one induced abortion in their lifetime.

The number of children that a woman bears depends on many factors, including the age she begins childbearing, how long she waits between births, and her fecundity. Postponing first births and extending the interval between births have played a role in reducing fertility levels in many countries. These factors also have positive health consequences. In contrast, short birth intervals (of less than 24 months) can lead to harmful outcomes for both newborns and their mothers, such as preterm birth, low birth weight, and death. Childbearing at a very young age is associated with an increased risk of complications during pregnancy and childbirth and higher rates of neonatal mortality.

This chapter describes the current level of fertility in Tajikistan and some of its proximate determinants. It presents information on the total fertility rate, birth intervals, insusceptibility to pregnancy (because of postpartum amenorrhea, postpartum abstinence, or menopause), age at first birth, teenage pregnancy, and induced abortion rates.

## 5.1 CURRENT FERTILITY

### Total fertility rate

The average number of children a woman would have by the end of her childbearing years if she bore children at the current age-specific fertility rates. Age-specific fertility rates are calculated for the 3 years before the survey, based on detailed pregnancy histories provided by women.

**Sample:** Women age 15–49

The total fertility rate (TFR) in Tajikistan is 3.5 children per woman (**Table 5.1**). The rate of childbearing peaks at 280 live births per 1,000 women in the 20–24 age group and then declines thereafter. The fertility rate is generally higher among women in rural areas than among those in urban areas, although this difference becomes less pronounced after age 24 (**Table 5.1** and **Table 5.2**). Fertility rates have been highest among women age 20–24 across the last 3 surveys and generally decline with age (**Table 5.3.1** and **Figure 5.1**).

**Trends:** The TFR has remained essentially unchanged since 2012 (**Figure 5.2**).

### Patterns by background characteristics

- The TFR varies slightly by region, with the lowest rate in Dushanbe (3.2) and the highest in Khatlon (3.6) (**Table 5.2** and **Map 5.1**).
- The TFR is lowest among women with a higher education (3.1). TFRs are similar among women with no education or a primary education, a general basic education, and a general secondary education have (3.5–3.6). The TFR is highest among women in the lowest wealth quintile (3.7) and lowest among women in the highest quintile (3.2).

**Figure 5.1 Trends in age-specific fertility**

**Figure 5.2 Trends in fertility by residence**

*TFR for the 3 years before each survey*

**Map 5.1 Fertility by region**

*TFR for the 3 years before the survey*

## 5.2 CHILDREN EVER BORN AND LIVING

Overall, women age 15–49 have an average of 2.1 children (**Table 5.4**). Currently married women have an average of 2.7 children, nearly all of whom are still alive (2.6). Among women overall, the average number of children ever born generally increases with age.

## 5.3 BIRTH INTERVALS

### Median birth interval

Number of months since the preceding birth by which half of children are born.

**Sample:** Non-first births in the 5 years before the survey

The World Health Organization (WHO) and other international organizations advise individuals and couples to wait at least 24–36 months between births to lower the likelihood of adverse maternal and child health outcomes (WHO 2006a). In Tajikistan, the median interval between live births is 32.6 months (**Table 5.5**). Thirty-one percent of non-first births occur within 23 months of a previous birth; 25% of births take place between 24 and 35 months after the previous birth, and 44% occur after an interval of 36 months or longer (**Figure 5.3**).

**Trends:** The median birth interval decreased from 30.8 months in 2012 to 28.8 months in 2017 before increasing to 32.6 months in 2023.

### Patterns by background characteristics

- Older mothers (age 30–49) tend to have longer birth intervals than younger mothers (age 15–29).
- The median birth interval is slightly shorter in rural areas than in urban areas (31.8 months versus 35.2 months).

**Figure 5.3 Birth intervals**

*Percent distribution of non-first births by number of months since the preceding birth*

## 5.4 INSUSCEPTIBILITY TO PREGNANCY

### **Postpartum amenorrhea**

The period of time after the end of a pregnancy and before the resumption of menstruation.

### **Postpartum abstinence**

The period of time after the end of a pregnancy and before the resumption of sexual intercourse.

### **Postpartum insusceptibility**

The period of time during which a woman is considered not at risk of pregnancy because she is postpartum amenorrheic and/or abstaining from sexual intercourse postpartum.

### **Median duration of postpartum amenorrhea**

Number of months after the end of a pregnancy by which time half of women have begun menstruating.

**Sample:** Women who had a live birth or stillbirth in the 3 years before the survey

### **Median duration of postpartum insusceptibility**

Number of months after the end of a pregnancy by which time half of women are no longer protected against pregnancy by either postpartum amenorrhea or abstinence from sexual intercourse.

**Sample:** Women who had a live birth or stillbirth in the 3 years before the survey

Overall, 23% of women who gave birth in the 3 years preceding the survey are insusceptible to pregnancy because they are amenorrheic (15%) and/or because they are abstaining from sexual intercourse (15%). Women are amenorrheic for a median of 2.7 months and abstain from sexual intercourse for a median of 2.4 months; the median period of insusceptibility is 4.2 months (**Table 5.6**).

**Trends:** The median duration of postpartum amenorrhea increased from 3.2 months to 4.6 months between 2012 and 2017 before decreasing to 2.7 months in 2023. Over the same period, the median duration of postpartum abstinence increased from 2.0 months to 2.9 months and then fell to 2.4 months. The median duration of postpartum insusceptibility rose from 4.1 months in 2012 to 6.8 months in 2017 before declining to 4.2 months in 2023.

### **Patterns by background characteristics**

- The median duration of postpartum insusceptibility is shorter among women age 15–29 (4.0 months) than among women age 30–49 (4.8 months) (**Table 5.7**).
- The duration of insusceptibility is shorter among urban mothers than rural mothers (3.3 months versus 4.5 months).
- There is no clear relationship between wealth and postpartum insusceptibility.

## 5.5 AGE AT FIRST MENSTRUATION

The mean age at menarche (first menstruation) across all women age 15–49 in Tajikistan is 14.4 years (**Table 5.8**).

## 5.6 ARRIVAL OF MENOPAUSE

### Menopause

Women are considered to have reached menopause if they are neither pregnant nor postpartum amenorrheic and have not had a menstrual period in the 6 months before the survey, if they report being menopausal or having had a hysterectomy, or if they have never menstruated.

**Sample:** Women age 30–49

Nine percent of all women age 30–49 in Tajikistan are menopausal. The percentage of women who are menopausal increases with age, reaching 37% among women age 48–49 (**Table 5.9**).

## 5.7 AGE AT FIRST BIRTH

### Median age at first birth

Age by which half of women have had their first child.

**Sample:** Women age 20–49 and 25–49

The median age at first live birth among women age 25–49 is 21.8 years. Very few women age 25–49 had a live birth by age 15 (less than 1%) or age 18 (2%). Seventy-seven percent of women had a live birth by age 25 (**Table 5.10**).

### Patterns by background characteristics

- Urban women have their first live birth slightly later (median age of 22.3 years) than rural women (median age of 21.7 years) (**Table 5.11**).
- The median age at first birth is highest among women with a higher education (23.4 years) and lowest among those with a general basic education (21.5 years).
- There is substantial variation by region, with women in Gorno-Badakhshan Autonomous Oblast (GBAO) having the highest median age at first birth (24.8 years) and women in Sughd having the lowest (21.4 years).

## 5.8 TEENAGE PREGNANCY

### Teenage pregnancy

Percentage of women age 15–19 who have ever been pregnant.

**Sample:** Women age 15–19

In Tajikistan, 7% of young women age 15–19 have ever been pregnant, 3% have ever had a live birth, and less than 1% reported experiencing a pregnancy loss (stillbirth, miscarriage, or abortion). Five percent of women age 15–19 are currently pregnant (**Table 5.12**). Less than 1% of young women reported initiating sexual intercourse before age 15 (see **Table 4.6**).

**Trends:** In the 2012 and 2017 surveys, miscarriages, stillbirths, and abortions were not included in the calculation of the teenage pregnancy indicator. Therefore, to estimate trends in teen pregnancy across surveys, the percentage of women age 15–19 who had begun childbearing (that is, who had ever had a live birth or who were pregnant at the time of the interview) was examined. This has remained stable at 7% since 2012.

### Patterns by background characteristics

- The teenage pregnancy rate is lower in urban areas than in rural areas (5% versus 8%).
- Teenage pregnancy varies by region. Three percent of young women living in Dushanbe have ever been pregnant, as compared with 10% of women living in Sughd (**Map 5.2**).

### Map 5.2 Teenage pregnancy by region

Percentage of women age 15–19 who have ever been pregnant

## 5.9 PREGNANCY OUTCOMES

### Pregnancy outcomes

**Live birth:** a child who was born alive, even if for a very short time

**Stillbirth:** a child who was born dead (no signs of life) following a pregnancy that lasted 7 months (28 weeks) or longer

**Miscarriage:** a pregnancy that ended involuntarily before completing 7 months (28 weeks)

**Induced abortion:** a pregnancy that was voluntarily ended

**Sample:** Pregnancies among women age 15–49 ending in the 3 years preceding the survey

Eighty-three percent of pregnancies ending in the 3 years preceding the survey resulted in live births, 12% were miscarriages, 1% were stillbirths, and 4% were induced abortions (**Table 5.13**).

### Patterns by background characteristics

- The percentage of women with live births is highest among those less than age 20 (93%) and lowest among those age 35–44 (70%). Miscarriages (19%) and induced abortions (10%) are higher among women age 35–44 than among their counterparts.
- The percentage of live births is highest among first pregnancies (94%). Conversely, higher-order pregnancies (fifth or higher) are least likely to result in live births (62%) and most likely to result in miscarriages (26%) and induced abortions (12%).
- The percentage of live births is slightly higher in rural areas than in urban areas (85% versus 79%), while the percentage of miscarriages is higher in urban areas (16% versus 10%).

## 5.10 INDUCED ABORTION

The total abortion rate (TAR) in 2023 is 0.2 abortions per woman and is similar in urban and rural areas (**Table 5.14**). The rate at which women have abortions increases with age, from 1 abortion per 1,000 women in the 15–19 age group to a peak of 11 abortions per 1,000 women in the 25–29 age group. The TAR in 2023 is lower than the rate reported in 2012 and 2017 (0.5 abortions per woman).

Five percent of women age 15–49 in Tajikistan report having at least one induced abortion in their lifetime. Among women who have had an induced abortion, 79% had one abortion, 19% had two to three abortions, and 1% had four or more abortions. The mean number of abortions per woman is 1.3 (**Table 5.15**).

Among women who reported an induced abortion in the 3 years prior to the survey, 42% cited not wanting a child at that time as the main reason, 30% mentioned maternal health concerns, and 14% were worried about the risk of birth defects (**Figure 5.4**).

### Patterns by background characteristics

- The prevalence of induced abortion increases with age, reaching 8% among women age 35 and above (**Table 5.15**).
- A higher percentage of currently married women reported having an induced abortion in their lifetime (6%) than formerly married women (4%) and never-married women (less than 1%).
- The percentage of women reporting induced abortions increases with number of living children. Less than 1% of women with no children reported having an induced abortion, as compared with 10% of women with four or more children.

## LIST OF TABLES

For more information on fertility levels and some of the determinants of fertility, see the following tables:

**Table 5.1 Current fertility**

Age-specific and total fertility rates, the general fertility rate, and the crude birth rate for the 3 years preceding the survey, according to residence, Tajikistan DHS 2023

| Age group   | Residence |       | Total |
|-------------|-----------|-------|-------|
|             | Urban     | Rural |       |
| 10–14       | [0]       | [0]   | [0]   |
| 15–19       | 36        | 51    | 47    |
| 20–24       | 245       | 292   | 280   |
| 25–29       | 192       | 184   | 186   |
| 30–34       | 107       | 107   | 107   |
| 35–39       | 56        | 58    | 58    |
| 40–44       | 12        | 15    | 14    |
| 45–49       | [2]       | [2]   | [2]   |
| TFR (15–49) | 3.2       | 3.5   | 3.5   |
| GFR         | 112       | 128   | 124   |
| CBR         | 25.4      | 27.8  | 27.1  |

Note: Age-specific fertility rates are per 1,000 women. Estimates in brackets are truncated. Rates are for the period 1–36 months preceding the interview. Rates for the 10–14 age group are based on retrospective data from women age 15–17.

TFR: total fertility rate, expressed per woman

GFR: general fertility rate, expressed per 1,000 women age 15–44

CBR: crude birth rate, expressed per 1,000 population

**Table 5.2 Fertility by background characteristics**

Total fertility rate for the 3 years preceding the survey, percentage of women age 15–49 currently pregnant, and mean number of children ever born to women age 40–49, according to background characteristics, Tajikistan DHS 2023

| Background characteristic   | Total fertility rate | Percent-age of women age 15–49 currently pregnant | Mean number of children ever born to women age 40–49 |
|-----------------------------|----------------------|---------------------------------------------------|------------------------------------------------------|
| <b>Residence</b>            |                      |                                                   |                                                      |

| Highest                     | 3.2                  | 6.6                                               | 3.1                                                  |
| <b>Total</b>                | 3.5                  | 7.6                                               | 3.3                                                  |

Note: Total fertility rates are for the period 1–36 months preceding the interview.

**Table 5.3.1 Trends in age-specific fertility rates**

Age-specific fertility rates for 5-year periods preceding the survey, according to age group, Tajikistan DHS 2023

| Age group | Number of years preceding survey |      |       |       |
|-----------|----------------------------------|------|-------|-------|
|           | 0–4                              | 5–9  | 10–14 | 15–19 |
| 10–14     | [0]                              | 0    | 0     | 0     |
| 15–19     | 49                               | 59   | 56    | 39    |
| 20–24     | 274                              | 300  | 254   | 218   |
| 25–29     | 187                              | 211  | 230   | 184   |
| 30–34     | 109                              | 130  | 122   | [133] |
| 35–39     | 53                               | 55   | [69]  |       |
| 40–44     | 15                               | [14] |       |       |
| 45–49     | [2]                              |      |       |       |

Note: Age-specific fertility rates are per 1,000 women. Estimates in brackets are truncated. Rates exclude the month of the interview. For the 0–4 year period, rates for the 10–14 age group are based on retrospective data from women age 15–19.

**Table 5.3.2 Trends in age-specific and total fertility rates**

Age-specific and total fertility rates (TFR) for the 3-year period preceding several surveys, according to mother's age at the time of the birth, Tajikistan DHS 2023

| Mother's age at birth | 2012 TjDHS | 2017 TjDHS | 2023 TjDHS |
|-----------------------|------------|------------|------------|
| 15–19                 | 54         | 54         | 47         |
| 20–24                 | 253        | 303        | 280        |
| 25–29                 | 216        | 207        | 186        |
| 30–34                 | 139        | 123        | 107        |
| 35–39                 | 69         | 55         | 58         |
| 40–44                 | 19         | 11         | 14         |
| 45–49                 | [2]        | [0]        | [2]        |
| TFR (15–49)           | 3.8        | 3.8        | 3.5        |

Note: Age-specific fertility rates are per 1,000 women. Rates for the 45–49 age group may be slightly biased due to truncation and are therefore displayed in brackets.

**Table 5.4 Children ever born and living**

Percent distribution of all women and currently married women age 15–49 by number of children ever born, mean number of children ever born, and mean number of living children, according to age group, Tajikistan DHS 2023

| Age group               | Number of children ever born |      |      |      |      |      |     |     |     |     |     | Total | Number of women | Mean number of children ever born | Mean number of living children |
|-------------------------|------------------------------|------|------|------|------|------|-----|-----|-----|-----|-----|-------|-----------------|-----------------------------------|--------------------------------|
|                         | 0                            | 1    | 2    | 3    | 4    | 5    | 6   | 7   | 8   | 9   | 10+ |       |                 |                                   |                                |
| ALL WOMEN               |                              |      |      |      |      |      |     |     |     |     |     |       |                 |                                   |                                |

Note: Figures in parentheses are based on 25–49 unweighted cases.

<sup>1</sup> Stillbirth, miscarriage, or abortion

<sup>2</sup> Women who have had a live birth or who are currently pregnant; excludes women who have had only a pregnancy that resulted in stillbirth, miscarriage, or abortion. This indicator should be used when making comparisons with TJDHS surveys implemented prior to 2023.

**Table 5.13 Pregnancy outcome by background characteristics**

Percent distribution of pregnancies ending in the 3 years preceding the survey by type of outcome, according to background characteristics, Tajikistan DHS 2023

| Background characteristic       | Pregnancy outcome |                         |                          |                  | Total | Number of pregnancies |

Note: An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Stillbirths are fetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are fetal death in pregnancies lasting 7 or more months.

<sup>2</sup> Miscarriages are fetal deaths in pregnancies lasting less than 28 weeks. When pregnancy duration is reported in months, miscarriages are fetal deaths in pregnancies lasting less than 7 months.

**Table 5.14 Induced abortion rates**

Age-specific and total induced abortion rates, and general abortion rates, for the 3 years preceding the survey, according to residence, Tajikistan DHS 2023

| Age group   | Residence |       | Total |
|-------------|-----------|-------|-------|
|             | Urban     | Rural |       |
| 10–14       | [0]       | [0]   | [0]   |
| 15–19       | [0]       | [1]   | [1]   |
| 20–24       | 6         | 8     | 8     |
| 25–29       | 11        | 11    | 11    |
| 30–34       | 8         | 5     | 6     |
| 35–39       | 6         | 9     | 8     |
| 40–44       | 1         | 2     | 2     |
| 45–49       | [0]       | [4]   | [3]   |
| TAR (15–49) | 0.2       | 0.2   | 0.2   |
| GAR         | 6         | 7     | 6     |

Note: Age-specific induced abortion rates are per 1,000 women. Estimates in brackets are truncated. Rates are for the period 1–36 months preceding the interview. Rates for the 10–14 age group are based on retrospective data from women age 15–17.

TAR: total induced abortion rate, expressed per woman

GAR: general induced abortion rate, expressed per 1,000 women age 15–44

**Table 5.15 Lifetime experience with induced abortion**

Percentage of women who have had at least one induced abortion, and among these women, percent distribution by number of abortions, and the mean number of abortions according to background characteristics, Tajikistan DHS 2023

| Background characteristic        | Percentage of women with an induced abortion | Number of women | Among women who had an abortion, percent distribution by number of abortions |        |       |       | Total   | Mean number of abortions | Number of women with abortions |

Note: Currently married includes respondents in consensual union (living together). Formerly married includes divorced, separated, and widowed respondents. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

## FERTILITY PREFERENCES

### Key Findings

- **Desire for another child:** 30% of currently married women age 15–49 want to have another child in the future.
- **Ideal family size:** The mean ideal family size is 3.4 children among women overall and 3.7 children among currently married women.
- **Fertility planning status:** 89% of all pregnancies that occurred in the 3 years before the survey were wanted at the time of conception, 5% were wanted later, and 6% were not wanted.
- **Wanted fertility:** The wanted fertility rate is 3.2 children per woman, while the total fertility rate is 3.5 children per woman.

Information on fertility preferences can help family planning program planners assess the desire for children, the extent of mistimed and unwanted pregnancies, and the demand for contraception to space or limit births. This information suggests the direction that fertility patterns could take in the future.

This chapter presents information on whether and when married women want more children, their ideal family size, whether the most recent birth was wanted, and the theoretical fertility rate if all unwanted births were prevented.

### 6.1 DESIRE FOR ANOTHER CHILD

#### Desire for another child

Women were asked whether they wanted more children and, if so, how long they would prefer to wait before the birth of the next child. Women who are sterilized are assumed not to want any more children.

**Sample:** Currently married women age 15–49

Overall, 19% of currently married women want to have another child soon (within the next 2 years), 5% want to have another child later (in 2 or more years), and 6% want to have another child but have not decided when (**Table 6.1**). Thirty-seven percent of currently married women declared that they want no more children or that they are sterilized. Twenty-five percent are undecided about whether they want more children.

**Trends:** The percentage of currently married women age 15–49 who want no more children or are sterilized decreased from 44% in the 2012 and 2017 TjDHS surveys to 37% in the 2023 TjDHS.

### Patterns by background characteristics

- The percentage of married women who want no more children is higher in Sughd (49%) than in the other regions (31%–34%) (**Table 6.2**).
- The percentage of currently married women who want no more children increases significantly with increasing number of living children, from 1% among those with no children to 69% among those with six or more children (**Figure 6.1**).

**Figure 6.1** Desire to limit childbearing by number of living children

*Percentage of currently married women age 15–49 who want no more children*

## 6.2 IDEAL FAMILY SIZE

### Ideal family size

Respondents with no children were asked “If you could choose exactly the number of children to have in your whole life, how many would that be?” Respondents who had children were asked “If you could go back to the time when you did not have any children and could choose exactly the number of children to have in your whole life, how many would that be?”

**Sample:** Women age 15–49

The mean ideal family size among all women age 15–49 in Tajikistan is 3.4 children (**Table 6.3**). The mean ideal family size is slightly higher among currently married women (3.7 children).

**Trends:** The mean ideal family size decreased slightly from the 2012 TjDHS to the 2017 TjDHS (from 3.6 to 3.4 children among all women and from 3.8 to 3.7 children among currently married women) and has since remained unchanged.

### Patterns by background characteristics

- The mean ideal number of children among all women increases from 2.7 children among those age 15–19 to 3.8 children among those age 40–44 before decreasing slightly to 3.7 among those age 45–49 (**Table 6.4**).
- Urban women, on average, have a slightly smaller ideal family size (3.3) than rural women (3.5).
- Mean ideal family size decreases slightly with increasing household wealth, from 3.6 children in the lowest wealth quintile to 3.3 children in the highest quintile.
- Mean ideal family size increases with increasing number of living children, from 2.8 children among women with no children to 5.5 children among those with six or more children (**Figure 6.2**).

**Figure 6.2** Ideal family size by number of living children

*Mean ideal number of children*

## 6.3 FERTILITY PLANNING STATUS

### Planning status of births/pregnancies

Women reported whether their births/pregnancies were wanted at the time (planned birth), at a later time (mistimed birth), or not at all (unwanted birth).

**Sample:** Current pregnancies and live births in the 3 years before the survey among women age 15–49 and all pregnancy outcomes in the 3 years before the survey among women age 15–49

Eighty-nine percent of all pregnancies in the 3 years preceding the survey were wanted at the time of conception, 5% were wanted later, and 6% were not wanted (Table 6.5).

With respect to all pregnancy outcomes during the 3-year period before the survey, the vast majority of current pregnancies (94%) and live births (95%) were wanted, while slightly less than two-thirds of miscarriages (63%) were wanted. Among pregnancies that resulted in abortions, more than half (59%) were either mistimed (23%) or unwanted (36%) (Figure 6.3).

**Trends:** The percentage of live births in the 3 years preceding the survey that were wanted at the time of conception has remained relatively stable over the past decade (93% in 2012 and 94% in 2023). The percentage of live births that were unwanted has also remained stable (3%).

### Patterns by background characteristics

- The percentage of live births that were wanted at the time of conception decreases with increasing birth order, from 98% among first births to 88% among fourth- and higher-order births (Table 6.5).
- The percentage of unwanted births increases with mother's age at birth, from less than 1% among women under age 20 at the time of birth to 14% among women age 40–44.

## 6.4 WANTED FERTILITY RATES

### Unwanted birth

Any birth in excess of the number of children a woman reported as her ideal number.

### Wanted birth

Any birth less than or equal to the number of children a woman reported as her ideal number.

### Wanted fertility rate

The average number of children a woman would have by the end of her childbearing years if she bore children at the current age-specific fertility rates, excluding unwanted births.

**Sample:** Women age 15–49

**Figure 6.3 Fertility planning status**

*Percent distribution of pregnancy outcomes among women age 15–49 in the 3 years before the survey by planning status of pregnancy*

Note: Sum may be greater than 100% due to rounding.

The wanted fertility rate is a measure of the potential demographic impact of fertility that would have prevailed in the 3 years preceding the survey if all unwanted births had been avoided. The total wanted fertility rate and the total fertility rate are calculated in the same manner. A birth is considered wanted if

the number of living children at the time of conception is lower than the ideal number of children reported by the woman. **Table 6.6** shows total wanted fertility rates and total fertility rates for the 3 years preceding the survey according to background characteristics.

The total wanted fertility rate is 3.2 children, while the actual fertility rate is 3.5 children; thus, on average, women are having 0.3 more children than they want (**Table 6.6**).

**Trends:** The total wanted fertility rate in Tajikistan increased from 3.3 in 2012 to 3.5 in 2017 before declining to 3.2 in 2023. The difference between the wanted and the actual fertility rate declined slightly from 0.5 in 2012 to 0.3 in 2017 and remained at 0.3 in 2023 (**Figure 6.4**).

#### Patterns by background characteristics

- The gap between wanted and actual fertility is minimal in both rural areas (0.2 children) and urban areas (0.1 children).
- The gap between wanted and actual fertility is larger in Khatlon (0.4 children) and Districts of Republican Subordination (DRS) (0.3 children) than in the other regions (0.1 children).

#### LIST OF TABLES

Note: Pregnancy outcome refers to a miscarriage, abortion, live birth, or stillbirth. Some pregnancies produce multiple outcomes, for example in the case of twins. In this table, each pregnancy outcome is counted individually. Therefore, a pregnancy is counted more than once if it produces multiple births (live births or stillbirths). Current pregnancies, miscarriages, and abortions are always counted as one pregnancy outcome. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> For pregnancies that resulted in multiple outcomes (for example, twins), each outcome is counted individually.

<sup>2</sup> For current pregnancies, the maternal age at birth is estimated as the mother's expected age at the time of the birth.

**Table 6.6 Wanted fertility rates**

Note: Rates are calculated based on births to women age 15–49 in the period 1–36 months preceding the survey. The total fertility rates are the same as those presented in Table 5.2.

### Key Findings

- **Contraceptive use:** Overall, 32% of currently married women use a method of family planning, with 28% using a modern method and 3% using a traditional method. The intrauterine device (IUD) is the most commonly used method (18%), followed by the male condom (4%).
- **Sources of contraceptive methods:** The majority of users of modern contraceptive methods (82%) obtain their methods from the public sector, with health centers (urban/rayon/rural) being the most common source (61%).
- **Contraceptive discontinuation:** Among contraceptive episodes experienced by women age 15–49 in the 5 years preceding the survey, 36% were discontinued within 12 months for any reason. Across all methods of contraception, the most common reason for discontinuation was the desire to become pregnant (35%).
- **Unmet need for family planning:** 21% of currently married women age 15–49 in Tajikistan have an unmet need for family planning (13% for spacing and 8% for limiting).
- **Demand for family planning:** The total demand for family planning that is satisfied is 61%; over half (54%) of the total demand is satisfied by modern methods.

Couples can use contraceptive methods to limit or space the number of children they have. This chapter presents information on use and sources of contraceptive methods, informed choice of methods, and rates and reasons for discontinuing contraceptives. It also examines the potential demand for family planning and how much contact nonusers have with family planning providers.

## 7.1 CONTRACEPTIVE KNOWLEDGE AND USE

High percentages of all women (91%), currently married women (98%), and sexually active unmarried women (87%) know of at least one contraceptive method (**Table 7.1**). The intrauterine device (IUD) is the most commonly known method among currently married women (96%), followed by the pill (91%) and the male condom (88%).

### Contraceptive prevalence

Percentage of women who use any contraceptive method.

**Sample:** All women age 15–49, currently married women age 15–49, and sexually active unmarried women age 15–49

### Modern methods

Include male and female sterilization, intrauterine devices (IUDs), injectables, implants, contraceptive pills, male and female condoms, emergency contraception, and the lactational amenorrhea method.

The contraceptive prevalence among all women is 24%, with 21% using modern methods. Contraceptive prevalence is higher among currently married women (32%), with 28% using modern methods. The IUD (18%) is by far the most widely used method among married women. Four percent report use of the male condom, 2% are using the pill, and 2% have been sterilized. Three percent of women report use of a traditional method, mostly withdrawal (**Table 7.3** and **Figure 7.1**).

The percentage of currently married women using any contraceptive method increases from 4% among those age 15–19 to a peak of 44% among those age 35–39 before declining to 29% among those age 45–49. The IUD is the most widely used method in all but the 15–19 age group, where the most commonly used methods are the lactational amenorrhea method and the male condom.

**Trends:** The use of modern contraceptive methods among currently married women has increased gradually over time, rising from 26% in 2012 to 28% in 2023. The use of traditional contraceptive methods among currently married women has remained stable during the past decade (2% in 2012 and 2017 and 3% in 2023) (**Table 7.4.1** and **Figure 7.2**).

### Patterns by background characteristics

- Use of modern contraceptives is substantially higher among currently married women with three or four children (38%) and five or more children (40%) than among women with no children (1%) (**Table 7.4.2**).

**Figure 7.1 Contraceptive use**

Percentage of women age 15–49 currently using a contraceptive method

**Figure 7.2 Trends in contraceptive use**

Percentage of currently married women currently using a contraceptive method

- There is a notable difference in use of modern contraceptive methods between urban and rural areas. Use of modern contraception is higher among currently married women living in urban areas (33%) than among those living in rural areas (27%).
- By region, the percentage of currently married women using modern contraceptive methods ranges from 22% in Districts of Republican Subordination (DRS) to 38% in Dushanbe (**Map 7.1**).

### Map 7.1 Modern contraceptive use by region

*Percentage of currently married women age 15–49 using a modern contraceptive method*

- Use of modern contraceptive methods generally increases with increasing household wealth; 37% of currently married women in the highest wealth quintile use modern contraception, as compared with 23% of those in the lowest quintile.

Use of contraception at the time of conception is low (**Table 7.5**). A modern method was used at the time of conception in only 3% of pregnancies in the 3 years preceding the survey that resulted in an induced abortion or a miscarriage. In 2% of pregnancies resulting in an induced abortion or a miscarriage, a traditional method was used, primarily withdrawal.

Use of sterilization is not common in Tajikistan (2% among all women). The median age at sterilization is 32.7 years. Among women who have been sterilized, 35% undergo the procedure between age 30 and age 34 (**Table 7.6**).

#### 7.1.1 Use of Emergency Contraception

Overall, 2% of women age 15–49 in Tajikistan have used emergency contraception in the past 12 months. Use of emergency contraception is higher among women age 30–34 (4%) than among women in both younger (age 15–19) (less than 1%) and older (age 45–49) (1%) age groups. Use of emergency contraception in the past 12 months is highest in Dushanbe (3%) (**Table 7.7**).

#### 7.1.2 Knowledge of the Fertile Period

Only 25% of women age 15–49 have correct knowledge of the fertile period during the ovulatory cycle, indicating a general lack of awareness about fertility among women. Knowledge of the fertile period increases with age, from 8% among women age 15–19 to 30% among women age 35–49 (**Table 7.8**).

## 7.2 SOURCE OF MODERN CONTRACEPTIVE METHODS

### Source of modern contraceptives

The place where the modern method currently being used was obtained the last time it was acquired.

**Sample:** Women age 15–49 currently using a modern contraceptive method

The majority of users of modern contraceptive methods (82%) obtain their methods from the public sector, with health centers (urban/rural) being the most common source (61%). A substantial percentage of pill users (50%) and male condom users (79%) acquire their methods from the private medical sector, particularly from pharmacies. Public maternity homes and health centers are the predominant sources of female sterilization and IUDs (Table 7.9 and Figure 7.3).

**Figure 7.3 Source of modern contraceptive methods**

Percent distribution of current users of modern methods age 15–49 by most recent source of method

## 7.3 INFORMED CHOICE

### Informed choice

Informed choice indicates that women were informed about their method's side effects, about what to do if they experience side effects, and about other methods they could use.

**Sample:** Women age 15–49 who are currently using selected modern contraceptive methods and who started the last episode of use within the 5 years before the survey

A substantial percentage of women currently using modern contraceptives were informed about possible side effects or problems associated with the method they used (90%), and 92% were advised on what to do if they experienced side effects. Eighty-nine percent of women were informed about other methods that they could use. Overall, 85% of women currently using modern contraceptive methods were provided with all three types of information at the time they started their last episode of use (Table 7.10). Women who obtained their contraceptives from the private medical sector were less informed across all categories than those who obtained their contraceptives from the public medical sector.

## 7.4 DISCONTINUATION OF CONTRACEPTIVES

### Contraceptive discontinuation rate

Percentage of contraceptive use episodes discontinued within 12 months.

**Sample:** Episodes of contraceptive use in the 5 years before the survey experienced by women who are currently age 15–49 (one woman may contribute more than one episode)

Among contraceptive episodes experienced by women age 15–49 in the 5 years preceding the survey, 36% were discontinued within 12 months for any reason (**Table 7.11**). The discontinuation rate was lowest among contraceptive episodes in which women used IUDs (22%).

Across all methods of contraception, the most common reason for discontinuation was the desire to become pregnant (35%). Among women using modern contraceptive methods, 42% of IUD users, 20% of users of injectables, 28% of pill users, and 40% of male condom users reported the desire to become pregnant as their reason for discontinuation. Women most commonly reported that they discontinued use of the withdrawal method because they wanted to become pregnant (27%) or because their husband disapproved (26%) (**Table 7.12**).

## 7.5 DEMAND FOR FAMILY PLANNING

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                           |

| <b>Proportion of demand satisfied by modern methods:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | $\frac{\text{Current contraceptive use (any modern method)}}{\text{Unmet need + current contraceptive use (any method)}}$ |

**Table 7.13.1** presents data on unmet need, met need, and total demand for family planning among currently married women. These indicators help evaluate the extent to which family planning programs in Tajikistan are meeting the demand for services.

Twenty-one percent of currently married women age 15–49 in Tajikistan have an unmet need for family planning (13% for spacing and 8% for limiting). Thirty-two percent of married women have a met need for family planning; that is, they are currently using contraception (**Figure 7.4**). The total demand for family planning is 52%, indicating that if all married women who said they want to space or limit their children were to use family planning methods, contraceptive prevalence would increase from 32% to 52%. The total demand for family planning that is satisfied is 61%; 54% of the total demand is satisfied by modern methods (**Table 7.13.1**).

Unmet need is somewhat lower among all women than among married women. Sixteen percent of all women have an unmet need for family planning (10% for spacing and 6% for limiting) (**Table 7.13.2**).

**Trends:** Total demand for family planning among currently married women age 15–49 has remained stable over the past decade, increasing only slightly from 51% in 2012 to 52% in 2017 and 2023. Unmet need for family planning increased from 26% to 27% between 2012 and 2017 and then decreased to 21% in 2023.

### Patterns by background characteristics

- Currently married women age 25–29 have the highest total unmet need for family planning (26%). After age 29, unmet need decreases with age, to a low of 7% among women age 45–49 (**Table 7.13.1**).
- Unmet need among currently married women is lowest in Gorno-Badakhshan Autonomous Oblast (GBAO) and Sughd (16%) and highest in DRS (26%) (**Table 7.13.1** and **Map 7.2**).

### Map 7.2 Unmet need for family planning by region

Percentage of currently married women age 15–49 with unmet need for family planning

### Figure 7.4 Demand for family planning

Percent distribution of currently married women age 15–49 by need for family planning

- Percentage of demand satisfied is slightly higher among urban women (64%) than among rural women (59%) (**Table 7.13.1**).

## 7.6 DECISION MAKING ABOUT FAMILY PLANNING AND OPINION ABOUT USING FAMILY PLANNING

Forty percent of currently married women reported that they made the decision to use or not use family planning methods jointly with their husband/partner, with 30% saying that their opinion and the opinion of their husband or partner were equally important. Twenty-seven percent said that they made their own decision, and 31% reported that their husband/partner mainly made the decision (**Table 7.14**). Overall, 67% of currently married women participate (either alone or jointly) in decision making about family planning (**Table 7.15**). Participation in decision making about family planning generally increases with age, number of living children, and household wealth. For example, 54% of women in the lowest wealth quintile and 77% in the highest quintile participate in decision making about family planning (**Table 7.15**).

## 7.7 PRESSURE TO BECOME PREGNANT AND FUTURE USE OF CONTRACEPTION

Overall, 3% of currently married women report that they were ever pressured by their husband/partner or any other family member to become pregnant when they did not want to. There is variation by region; only 1% of women in GBAO reported ever being pressured by their husband/partner or another family member, as compared with 3% of women in Dushanbe, DRS, and Khatlon (**Table 7.16**).

Twenty-two percent of currently married women age 15–49 who are not using a contraceptive method intend to use contraception in the future, while 47% do not intend to use contraception in the future and 31% are unsure (**Table 7.17**). The percentage of currently married women who intend to use contraception rises with number of living children, from 14% among those with no children to 24% among those with four or more children.

## 7.8 EXPOSURE TO FAMILY PLANNING MESSAGES

**Table 7.18** presents information on women's exposure to family planning messages through various sources in the 12 months before the survey. Television is the most common source of family planning messages (38%), followed by newspapers and magazines (21%); posters, leaflets, or brochures (15%); and social media (15%). However, 52% of currently married women reported that they had no exposure to family planning messages through any of the eight specified sources.

## 7.9 CONTACT OF NONUSERS WITH FAMILY PLANNING PROVIDERS

### Contact of nonusers with family planning providers

Respondent discussed family planning in the 12 months before the survey with a medical worker or during a visit to a health facility.

**Sample:** Women age 15–49 who are not currently using any contraceptive methods

A substantial percentage of women who are not using contraception did not discuss family planning either with a medical worker or at a health facility in the past 12 months. Specifically, 54% of these women had no such discussions (**Table 7.19**).

### Patterns by background characteristics

- Among women who are not using contraception, a higher percentage of those in rural areas (57%) than urban areas (47%) did not discuss family planning either with a medical worker or at a health facility in the past 12 months (**Table 7.19**).

- The percentage of women not using contraception who did not discuss family planning either with a medical worker or at a health facility in the past 12 months is higher among those age 15–19 (81%) than among those in the other age groups (38%–58%).

## LIST OF TABLES

Note: Table includes users of only the methods listed individually. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

na = not applicable

<sup>1</sup> The method information index is the percentage of women who were informed about (1) side effects or problems of method used, (2) what to do if they experienced side effects, and (3) other methods that could be used.

<sup>2</sup> Source at start of current episode of use

<sup>3</sup> Includes family medicine center and other public sector

**Table 7.11 Twelve-month contraceptive discontinuation rates**

Among episodes of contraceptive use experienced within the 5 years preceding the survey, percentage of episodes discontinued within 12 months, according to reason for discontinuation and specific method, Tajikistan DHS 2023

| Method             | Method failure | Desire to become pregnant | Other fertility-related reasons <sup>1</sup> | Changes in menstrual bleeding | Other side effects/health concerns | Wanted more effective method | Other method-related reasons <sup>2</sup> | Husband/partner disapproved | Other reasons <sup>3</sup> | Any reason <sup>4</sup> | Switched to another method <sup>5</sup> | Number of episodes of use <sup>6</sup> |

Note: Figures are based on life table calculations using information on episodes of use that occurred 3–62 months preceding the survey. Figures in parentheses are based on 25–49 unweighted cases.

<sup>1</sup> Includes infrequent sex/husband away, difficult to get pregnant/menopausal, and marital dissolution/separation

<sup>2</sup> Includes lack of access/too far, costs too much, and inconvenient to use

<sup>3</sup> Includes up to God/fatalistic and other reasons

<sup>4</sup> Reasons for discontinuation are mutually exclusive and add to the total given in this column.

<sup>5</sup> A woman is considered to have switched to another method if she used a different method in the month following discontinuation or if she gave “wanted a more effective method” as the reason for discontinuation and started another method within 2 months of discontinuation.

<sup>6</sup> All episodes of use that occurred within the 5 years preceding the survey are included. Episodes of use include both episodes that were discontinued during the period of observation and episodes that were not discontinued during the period of observation.

<sup>7</sup> Includes lactational amenorrhea method (LAM), injectables, implants, female condom, emergency contraception, rhythm, other modern methods, and other traditional methods.

**Table 7.12 Reasons for discontinuation**

Percent distribution of discontinuations of contraceptive methods in the 5 years preceding the survey by main reason stated for discontinuation, according to specific method, Tajikistan DHS 2023

| Reason                               | IUD   | Injectables | Pill  | Male condom | Withdrawal | Other <sup>1</sup> | All methods |
|--------------------------------------|-------|-------------|-------|-------------|------------|--------------------|-------------|

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al. 2012.

<sup>1</sup> Total demand is the sum of unmet need and met need.

<sup>2</sup> Percentage of demand satisfied is met need divided by total demand.

<sup>3</sup> Modern methods include female sterilization, male sterilization, IUD, injectables, implants, pill, male condom, female condom, emergency contraception, lactational amenorrhea method (LAM), and other modern methods.

**Table 7.13.2 Need and demand for family planning among all women**

Percentage of all women age 15–49 with unmet need for family planning, percentage with met need for family planning, total demand for family planning, percentage of the demand for family planning that is satisfied, and percentage of the demand for family planning that is satisfied by modern methods, according to background characteristics, Tajikistan DHS 2023

| Background characteristic | Unmet need for family planning |              |       | Met need for family planning (currently using) |              |       | Total demand for family planning <sup>1</sup> |              |       | Number of women | Percentage of demand satisfied <sup>2</sup> | Percentage of demand satisfied by modern methods <sup>3</sup> |

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al. 2012.

<sup>1</sup> Total demand is the sum of unmet need and met need.

<sup>2</sup> Percentage of demand satisfied is met need divided by total demand.

<sup>3</sup> Modern methods include female sterilization, male sterilization, IUD, injectables, implants, pill, male condom, female condom, emergency contraception, lactational amenorrhea method (LAM), and other modern methods.

**Table 7.14 Decision making about family planning**

Percent distribution of currently married women by person who usually makes the decision to use or not use family planning, Tajikistan DHS 2023

| Decision maker                                           | Percentage   |
|----------------------------------------------------------|--------------|
| Mainly wife                                              | 27.0         |
| Wife and husband/partner jointly                         | 39.5         |
| Wife's opinion more important                            | 6.7          |
| Wife's and husband's/partner's opinion equally important | 30.4         |
| Wife's opinion less important than husband's/partner's   | 2.4          |
| Mainly husband                                           | 30.6         |
| Someone else/other                                       | 2.9          |
| <b>Total</b>                                             | <b>100.0</b> |
| Number of currently married women                        | 7,392        |

**Table 7.15 Decision making about family planning by background characteristics**

Percent distribution of currently married women age 15–49 by person who usually makes the decision to use or not use family planning and percentage who participate in the decision to use or not use family planning, according to background characteristics, Tajikistan DHS 2023

| Background characteristic        | Mainly wife | Wife and husband/<br>partner jointly | Mainly husband/<br>partner | Someone else/other | Total | Percentage who participate in decision making about family planning | Number of women |
|----------------------------------|-------------|--------------------------------------|----------------------------|--------------------|-------|---------------------------------------------------------------------|-----------------|

**Table 7.19 Contact of nonusers with family planning providers**

Among women age 15–49 who are not using contraception, percentage who during the past 12 months were visited by a medical worker who discussed family planning, percentage who visited a health facility and discussed family planning, percentage who visited a health facility but did not discuss family planning, and percentage who did not discuss family planning either with a medical worker or at a health facility, according to background characteristics, Tajikistan DHS 2023

| Background characteristic | Percentage of women who were visited by a medical worker who discussed family planning | Percentage of women who visited a health facility in the past 12 months and who: |                                 | Percentage of women who did not discuss family planning either with a medical worker or at a health facility | Number of women |

## INFANT AND CHILD MORTALITY

### Key Findings

- **Childhood mortality rates:** During the 5 years immediately preceding the survey, the neonatal mortality rate was 10 deaths per 1,000 live births, the infant mortality rate was 20 deaths per 1,000 live births, and the under-5 mortality rate was 24 deaths per 1,000 live births.
- **Trends in infant and child mortality:** Neonatal mortality decreased from 19 deaths per 1,000 live births in the 5 years preceding the 2012 survey to 10 deaths per 1,000 live births in the 5 years preceding the 2023 survey. The infant mortality rate also showed a substantial decline, falling from 34 deaths per 1,000 live births in the 5 years preceding the 2012 survey to 20 deaths per 1,000 live births in the 5 years preceding the 2023 survey. Similarly, under-5 mortality dropped from 43 deaths per 1,000 live births in the 5 years preceding the 2012 survey to 24 deaths per 1,000 live births in the 5 years preceding the 2023 survey.
- **Perinatal mortality:** The perinatal mortality rate was 13 deaths per 1,000 pregnancies of 28 or more weeks' duration in the 5 years preceding the survey.
- **High-risk fertility behavior:** 74% of currently married women age 15–49 would have been in an avoidable high-risk category if they had conceived at the time of the survey; 34% would have been in a single high-risk category, and 40% would have been in a multiple high-risk category.

Information on infant and child mortality is relevant to a demographic assessment of a country's population and is an important indicator of the country's socioeconomic development and people's quality of life. It can also help identify children who may be at higher risk of death and lead to strategies to reduce this risk, such as promoting birth spacing.

This chapter presents information on levels, trends, and differentials in perinatal, neonatal, infant, and under-5 mortality rates. It also examines biodemographic factors and fertility behaviors that increase mortality risks for infants and children. The information was collected as part of a retrospective pregnancy history in which female respondents listed all of the children to whom they have given birth, along with each child's date of birth, survivorship status, and current age or age at death.

The quality of mortality estimates calculated from pregnancy histories depends on the mother's ability to recall all of the children she has given birth to, as well as their birth dates and ages at death. Potential data quality problems include:

- The selective omission from pregnancy histories of those births that did not survive, which can result in underestimation of childhood mortality.
- The displacement of birth dates, which could distort mortality trends. This can occur if an interviewer records a birth as occurring in a different year than the one in which it occurred. This could happen if

an interviewer is trying to cut down on his or her overall workload, because live births occurring during the 3 years before the interview are the subject of a lengthy set of additional questions.

- The quality of reporting of age at death. Misreporting the child's age at death may distort the age pattern of mortality, especially if the net effect of the age misreporting is to transfer deaths from one age bracket to another.
- Any method of measuring childhood mortality that relies on mothers' reports (for example, birth histories) assumes that female adult mortality is not high or, if it is high, that there is little or no correlation between the mortality risks of mothers and those of their children.

Selected indicators of the quality of the mortality data on which the estimates of mortality in this chapter are based are presented in Appendix C, **Tables C.5** and **C.6**.

Some underreporting of child deaths relative to the 2012 survey was identified during a review of the data quality tables.

Appendix C, **Figure C.2** shows neonatal, infant, and under-5 mortality estimates for the 0–4, 5–9, and 10–14 years prior to the 2023, 2017, and 2012 TjDHS surveys. It is expected that the 5–9 year estimate for 2023 would generally overlap with the 0–4 year estimate for 2017 and that the 10–14 year estimate for 2023 would generally overlap with the 5–9 year estimate for 2017 and the 0–4 year estimate for 2012. However, **Figure C.2** does not depict this overlap, suggesting that mortality may be underestimated in the 2023 TjDHS, slightly overestimated in the 2017 TjDHS, or some combination of both.

## 8.1 INFANT AND CHILD MORTALITY

**Neonatal mortality:** The probability of dying within the first month of life.

**Postneonatal mortality:** The probability of dying between the first month of life and the first birthday (computed as the difference between infant and neonatal mortality).

**Infant mortality:** The probability of dying between birth and the first birthday.

**Child mortality:** The probability of dying between the first and the fifth birthday.

**Under-5 mortality:** The probability of dying between birth and the fifth birthday.

During the 5 years immediately preceding the survey, the neonatal mortality rate was 10 deaths per 1,000 live births, the infant mortality rate was 20 deaths per 1,000 live births, and the under-5 mortality rate was 24 deaths per 1,000 live births (**Table 8.1**). Neonatal deaths account for almost half of all infant deaths.

**Trends:** Neonatal mortality decreased from 19 deaths per 1,000 live births in the 5 years preceding the 2012 survey to 10 deaths per 1,000 live births in the 5 years preceding the 2023 survey. The infant mortality rate also showed a substantial decline, falling from 34 deaths per 1,000 live births in the 5 years preceding the 2012 survey to 20 deaths per 1,000 live births in the 5 years preceding the 2023 survey. Similarly, under-5 mortality dropped from 43 deaths per 1,000 live births in the 5 years preceding the 2012 survey to 24 deaths per 1,000 live births in the 5 years preceding the 2023 survey (**Figure 8.1**).

**Figure 8.1 Trends in early childhood mortality rates**

### Patterns by background characteristics

- The neonatal mortality rate is slightly higher among female children (11 deaths per 1,000 live births) than among male children (8 deaths per 1,000 live births). Neonatal mortality is the same in urban and rural areas (10 deaths per 1,000 live births) (**Table 8.2**).
- Infant mortality rates are nearly identical for male children (21 deaths per 1,000 live births) and female children (20 deaths per 1,000 live births). Infant mortality is slightly higher in rural areas (21 deaths per 1,000 live births) than in urban areas (18 deaths per 1,000 live births).
- There is a small difference in under-5 mortality rates between male and female children (23 and 25 deaths per 1,000 live births, respectively). Under-5 mortality is higher in rural areas (25 deaths per 1,000 live births) than in urban areas (21 deaths per 1,000 live births).

**Table 8.3** presents data on the relationship between additional background characteristics and child mortality for the 10-year period preceding the survey. A 10-year period was used to increase the reliability of the estimates calculated.

### Patterns by additional background characteristics

- The neonatal mortality rate for the 10-year period preceding the survey varies substantially by region, ranging from 4 deaths per 1,000 live births in Khatlon to 13 deaths per 1,000 live births in Dushanbe. Infant and under-5 mortality rates were also lowest in Khatlon (15 and 19 deaths per 1,000 live births, respectively), while Districts of Republican Subordination (DRS) had the highest rates (24 and 29 deaths per 1,000 live births, respectively) (**Table 8.3**). However, these estimates should be interpreted with caution as mortality rates are relatively low, the numbers of reported deaths are small, and the estimates have relatively large confidence intervals, indicating little statistical difference between estimates. There is possible underreporting of deaths in certain regions and in poorer and lesser educated populations. Please review the confidence intervals for mortality rates in Appendix B to better assess the estimates.

- Children of young mothers (age 20 or below) had the highest rates of neonatal mortality (11 deaths per 1,000 live births), infant mortality (24 deaths per 1,000 live births), and under-5 mortality (28 deaths per 1,000 live births) (Figure 8.2).

## 8.2 PERINATAL MORTALITY

### Perinatal mortality rate

Perinatal deaths comprise stillbirths (pregnancy losses occurring after 28 weeks of gestation) and early neonatal deaths (deaths of live births within the first 7 days of life). The perinatal mortality rate is calculated as the number of perinatal deaths per 1,000 pregnancies of 28 or more weeks' duration.<sup>1</sup>

**Sample:** Number of pregnancies of 28 or more weeks' duration among women age 15–49 in the 5 years before the survey

The causes of stillbirths and early neonatal deaths are closely linked, and examining only early neonatal deaths can understate the true level of mortality around delivery. The perinatal mortality rate encompasses both stillbirths and early neonatal deaths and, thus, provides a better measure of mortality at the time of delivery.

In 2014 the Every Newborn Action Plan, a global multipartner movement to end preventable maternal and newborn deaths and stillbirths, set a target for national stillbirth rates of 12 or fewer stillbirths per 1,000 births in all countries by 2030 (WHO and UNICEF 2014).

**Table 8.4** presents the number of stillbirths, the number of early neonatal deaths, and related mortality rates for the 5-year period preceding the survey, by demographic and socioeconomic characteristics. Notably, there were 30 stillbirths and 39 early neonatal deaths reported. It is important to consider that these figures are likely underestimated due to underreporting, and the small number of events means that perinatal mortality rates for various subgroups are based on very few cases, potentially impacting the reliability of these rates.

<sup>1</sup> The *International Classification of Diseases, Eleventh Revision (ICD-11)* criteria for international reporting of stillbirths and/or neonatal deaths are set at 28 completed weeks of gestation or more, while countries are encouraged to provide, where possible, data from 22 completed weeks or more as well (WHO 2022). The *ICD-11* defines perinatal mortality as the number of fetal deaths of at least 28 weeks of gestation and/or 1,000 g in weight and newborn deaths (up to and including the first 7 days after birth) per 1,000 total births (that is, including stillbirths and live births) (WHO 2021; WHO 2022). DHS surveys report the rate based on all pregnancies of 7 or more months (or 28 weeks of gestation or more) that terminated in a fetal death along with pregnancies that ended with a live birth, which is the equivalent of total births.

In the 2023 Tajikistan DHS, the 30 recorded stillbirths equate to a rate of 6 stillbirths per 1,000 pregnancies of 28 or more weeks' duration. The 39 early neonatal deaths reported during the same period equate to a rate of 7 early neonatal deaths per 1,000 live births. This results in a perinatal mortality rate of 13 deaths per 1,000 pregnancies of 28 or more weeks' duration,<sup>2</sup> which is slightly higher than the target set by the Every Newborn Action Plan. However, these results should be interpreted with caution as perinatal mortality is likely underestimated.

### Patterns by background characteristics

- Perinatal mortality is substantially higher among mothers age 40–49 (88 deaths per 1,000 pregnancies) than among younger mothers (**Figure 8.3**). The substantial difference is likely due, in part, to the very low number of pregnancies of 28 or more weeks' duration (only 82) recorded in the 40–49 age group relative to the other age groups.
- The perinatal mortality rate is higher in urban areas (16 deaths per 1,000 pregnancies) than in rural areas (12 deaths per 1,000 pregnancies).
- Perinatal mortality is lowest in the lowest wealth quintile (9 deaths per 1,000 pregnancies) and highest in the fourth and highest wealth quintiles (17 deaths per 1,000 pregnancies).

**Figure 8.3 Perinatal mortality by mother's age at birth**

*Deaths per 1,000 pregnancies of 28 or more weeks' duration in the 5-year period before the survey*

## 8.3 HIGH-RISK FERTILITY BEHAVIOR

The survival of infants and children depends in part on the demographic and biological characteristics of their mothers. Typically, the probability of dying in infancy is much greater among children born to mothers who are too young (under age 18) or too old (over age 34), children born after a short birth interval (less than 24 months after the preceding birth), and children born to mothers of high parity (more than three children). **Table 8.5** gives the percent distribution of children born in the 5 years preceding the survey by category of elevated risk of mortality (along with risk ratios) and the percent distribution of currently married women by their category of risk if they were to conceive a child at the time of the survey.

Thirty-one percent of births in the 5 years preceding the survey were not in any high-risk category. Twenty-eight percent of births were in an unavoidable risk category, that is, first-order births to women between age 18 and age 34. Forty-two percent of births were in an avoidable high-risk category; 33% were in a single high-risk category (mother's age less than 18 years, mother's age more than 34 years, birth interval less than 24 months, and birth order greater than three), and 9% were in multiple high-risk categories.

The risk ratio denotes the relationship between risk factors and mortality. For example, the risk of dying for a child who falls into any of the avoidable high-risk categories is 1.44 times that for a child not in any high-risk category.

<sup>2</sup> The TjDHS classification of perinatal deaths differs somewhat from that used by the Tajik Republic Ministry of Health and Social Protection of Population (MoHSPP). In calculating perinatal mortality, the current Tajik MoHSPP approach includes early neonatal deaths and stillbirths occurring after 24 weeks of pregnancy in the numerator of the rate and total births (stillbirths and live births) in the denominator. When the 2023 TjDHS perinatal mortality rate is recalculated using this cutoff, the estimate of the perinatal mortality rate is 15 per 1,000 (data not shown).

Among births in a single high-risk category, the risk ratio is highest for births to mothers over age 34; children born to mothers older than age 34 are 1.66 times more likely to die than those not in any risk category.

Among births in multiple high-risk categories, the risk of dying is highest for births to mothers above age 34 and with a birth order greater than three. Children born to mothers in these risk categories are 3.13 times more likely to die than those born to mothers who are not in any high-risk category.

Seventy-four percent of currently married women age 15–49 would have been in an avoidable high-risk category if they had conceived at the time of the survey; 34% would have been in a single high-risk category, and 40% would have been in a multiple high-risk category (**Table 8.5**).

## 8.4 REGISTRATION OF CHILD DEATHS

Vital registration systems are a key instrument for tracking mortality trends. The 2023 TjDHS included several questions relating to registration of deaths with the State Office for Registration of Civil Status (ZAGS) in Tajikistan. A death certificate was available for 24% of children who died in the 5 years before the survey; in the case of 34% of children who died, a death certificate was not available but the mother reported that the death was registered with the civil authorities (**Figure 8.4**). Thirty-two percent of children who died did not have their deaths registered.

### LIST OF TABLES

For more information on infant and child mortality, see the following tables:

- **Table 8.1** Early childhood mortality rates
- **Table 8.2** Five-year early childhood mortality rates according to background characteristics
- **Table 8.3** Ten-year early childhood mortality rates according to additional characteristics
- **Table 8.4** Perinatal mortality
- **Table 8.5** High-risk fertility behavior

Note: An asterisk indicates that a figure is based on fewer than 250 unweighted children and has been suppressed.

<sup>1</sup> Computed as the difference between the infant and neonatal mortality rates

<sup>2</sup> Excludes first-order births

**Table 8.4 Perinatal mortality**

Number of stillbirths, number of early neonatal deaths, stillbirth rate, early neonatal death rate, perinatal mortality rate, and the ratio of stillbirths to early neonatal deaths for the 5-year period preceding the survey, according to background characteristics, Tajikistan DHS 2023

| Background characteristic                                | Number of stillbirths <sup>1</sup> | Number of early neonatal deaths <sup>2</sup> | Stillbirth rate <sup>3</sup> | Early neonatal death rate <sup>4</sup> | Perinatal mortality rate <sup>5</sup> | Number of pregnancies of 28+ weeks' duration <sup>6</sup> | Ratio of stillbirths to early neonatal deaths |

Note: Respondents may choose to report the duration of their pregnancy in either weeks or months.

<sup>1</sup> Stillbirths are fetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are fetal deaths in pregnancies lasting 7 or more months.

<sup>2</sup> Early neonatal deaths are deaths at age 0–6 days among live-born children.

<sup>3</sup> The number of stillbirths divided by the number of pregnancies lasting 28 or more weeks, expressed per 1,000

<sup>4</sup> The number of early neonatal deaths divided by the number of live births, expressed per 1,000

<sup>5</sup> The sum of the number of stillbirths and early neonatal deaths divided by the number of pregnancies lasting 28 or more weeks, expressed per 1,000

<sup>6</sup> Includes pregnancies lasting 7 or more months when duration of pregnancy is reported in months

<sup>7</sup> Pregnancy interval categories correspond to birth interval categories of <24 months, 24–35 months, 36–47 months, and 48+ months assuming a pregnancy duration of 9 months.

**Table 8.5 High-risk fertility behavior**

Percent distribution of children born in the 5 years preceding the survey by category of elevated risk of mortality and the risk ratio, and percent distribution of currently married women by category of risk if they were to conceive a child at the time of the survey, Tajikistan DHS 2023

| Risk category                                               | Births in the 5 years preceding the survey |            | Percentage of currently married women <sup>1</sup> |
|-------------------------------------------------------------|--------------------------------------------|------------|----------------------------------------------------|
|                                                             | Percentage of births                       | Risk ratio |                                                    |
| <b>Not in any high-risk category</b>                        | 30.6                                       | 1.00       | 17.5 <sup>a</sup>                                  |
| <b>Unavoidable risk category</b>                            |                                            |            |                                                    |
| First-order births between age 18 and age 34                | 27.9                                       | 1.09       | 8.3                                                |

Note: Risk ratio is the ratio of the proportion dead among births in a specific high-risk category to the proportion dead among births not in any high-risk category. Ratios in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a ratio is based on fewer than 25 unweighted cases and has been suppressed.

na = not applicable

nc = no cases

<sup>1</sup> Women are assigned to risk categories according to the status they would have at the birth of a child if they were to conceive at the time of the survey: current age less than 17 years and 3 months or older than 34 years and 2 months, latest birth less than 15 months ago, or latest birth being of order 3 or higher.

<sup>2</sup> Includes the category age <18 and birth order >3

<sup>a</sup> Includes sterilized women

## Key Findings

- **Antenatal care:** 81% of women age 15–49 received antenatal care (ANC) from a skilled provider for their most recent live birth in the 2 years preceding the survey.
- **Delivery:** Institutional deliveries increased substantially from 78% in 2012 to 95% in 2023. Over the same period, home deliveries declined from 22% to 5%.
- **Postnatal checks:** 89% of women received a postnatal check during the first 2 days after the delivery of their most recent live birth, with 75% receiving a postnatal check within 4 hours of delivery.
- **Cancer examinations:** 6% of women age 15–49 have ever been examined by a doctor or health care worker for breast cancer, and 9% have ever been tested for cervical cancer.
- **Problems accessing health care:** The percentage of women reporting at least one problem accessing health care decreased from 55% in 2012 to 17% in 2023.

**H**ealth care services during pregnancy and childbirth and after delivery are important for the survival and well-being of both the mother and the infant. Antenatal care (ANC) can reduce health risks for mothers and infants through monitoring of pregnancies and screening for complications. Delivery at a health facility, with skilled medical attention and hygienic conditions, reduces the risk of complications and infections during labor and delivery. Timely postnatal care provides an opportunity to treat complications arising from delivery and teach the mother how to care for herself and her newborn.

The first part of this chapter presents information on ANC providers, number and timing of ANC visits, and various components of care. The second focuses on childbirth and provides information on place of delivery, assistance during delivery, and cesarean deliveries. The third section focuses on postnatal care and presents information on postnatal health checks for mothers and newborns. The final section covers issues that affect women’s health regardless of their maternal status: whether or not women have been examined for breast or cervical cancer, problems they experience accessing health care, and the distance from their home to the nearest health facility.

## 9.1 ANTENATAL CARE COVERAGE AND CONTENT

### 9.1.1 Skilled Providers

#### Antenatal care (ANC) from a skilled provider

Pregnancy care received from skilled providers, such as doctors (including family doctors, obstetricians, and gynecologists) and nurses/male nurses/midwives.

**Sample:** Women age 15–49 who had a live birth or stillbirth in the 2 years before the survey

Overall, 81% of women age 15–49 received ANC from a skilled provider for their most recent live birth in the 2 years preceding the survey. Obstetricians and gynecologists were the most common service providers (46%), followed by family doctors (26%), other doctors (6%), and nurses, male nurses, or midwives (4%). Nineteen percent of women did not receive any ANC (**Table 9.1**).

**Trends:** The percentage of women with a live birth in the 2 years preceding the survey who received antenatal care from a skilled provider increased from 80% in 2012 to 94% in 2017 before decreasing to 81% in 2023 (**Figure 9.1**).

**Figure 9.1 Trends in antenatal care coverage**

*Percentage of women age 15–49 who had a live birth in the 2 years before the survey (for the most recent birth)*

### Patterns by background characteristics

- The percentage of women who received ANC from skilled providers varies substantially by region, from 71% in Khatlon to 91% in Dushanbe and 93% in Gorno-Badakhshan Autonomous Oblast (GBAO).
- The percentage of women receiving care from a skilled provider increases with increasing household wealth, from 66% among those in the lowest wealth quintile to 88% among those in the highest wealth quintile. Conversely, the percentage of women who did not receive any ANC declines from 34% in the lowest wealth quintile to 12% in the highest quintile.
- A higher percentage of women under age 20 (86%) than women age 20–34 (81%) and 35–49 (79%) received ANC from a skilled provider. The percentage of women not receiving ANC increases with age, from 14% among those under age 20 to 21% among those age 35–49.

### 9.1.2 Timing and Number of Antenatal Care Visits

Sixty-two percent of women had four or more ANC visits during their most recent pregnancy resulting in a live birth in the 2 years preceding the survey. Sixty-two percent of women had their first ANC visit during the first trimester of pregnancy and 17% during the second trimester. Only 2% of women waited until the third trimester to have their first ANC visit (**Table 9.2**).

**Trends:** The percentage of women who had four or more ANC visits increased from 52% in 2012 to 65% in 2017 before decreasing to 62% in 2023 (**Figure 9.1**). Similarly, the percentage of women who received ANC in the first trimester of pregnancy increased from 52% in 2012 to 68% in 2017 and then declined to 62% in 2023.

## 9.2 COMPONENTS OF ANTENATAL CARE

### Components of antenatal care

Specific antenatal care services performed by a health care provider include measuring blood pressure, taking a urine sample, taking a blood sample, listening for the baby's heartbeat, counseling about the mother's diet, counseling about breastfeeding, and asking about vaginal bleeding.

**Sample—quality of care indicator:** Women age 15–49 who had a live birth or stillbirth in the 2 years before the survey and had at least one ANC visit

**Sample—population-based indicator:** All women age 15–49 who had a live birth or stillbirth in the 2 years before the survey

The ability for ANC to act as an effective intervention for identifying issues occurring during pregnancy that could adversely affect pregnancy outcomes is dictated in large part by the components of ANC services offered by the health care provider.

As a part of ANC, certain interventions and tests are recommended at each ANC contact. These include the following:

- Measuring blood pressure. Taking a woman's blood pressure at each antenatal care visit is essential to monitor for gestational hypertension or preeclampsia.
- Conducting urine and blood tests. These tests assess signs of infection or other diseases and conditions that could negatively affect a woman or her baby during or after pregnancy.
- Listening to the baby's heartbeat. This can confirm that the fetus is alive as well as reassure the mother.
- Counseling on maternal nutrition, specifically on healthy eating during pregnancy and breastfeeding. These counseling messages promote healthy weight gain during pregnancy and can help the pregnant woman breastfeed her newborn early.
- Asking about vaginal bleeding. Light bleeding or spotting is common, especially during the first few months of a pregnancy. Heavy bleeding may be a sign of something more serious; a pregnant woman experiencing heavy bleeding should visit a health care provider.

In the 2023 TjDHS, data collected on components of ANC were tabulated in two ways. **Table 9.3.1** shows the percentage of women with a live birth or stillbirth in the 2 years before the survey who reported that they had at least one ANC visit and received specified ANC services. This tabulation is a measure of the quality of the ANC services these women received. **Table 9.3.2** shows the percentage of all women with a live birth or stillbirth in the past 2 years who received specified ANC services, regardless of whether they reported an ANC visit. This tabulation is a measure of coverage of these key ANC interventions among the population of women in need of them.

Among women age 15–49 who received antenatal care (ANC) for their most recent live birth in the 2 years preceding the survey, nearly all had a urine sample taken (99%), had their blood pressure measured (more than 99%), had a blood sample taken (99%), and had the baby's heartbeat checked (more than 99%). Most women were counseled about their diet (95%) and about breastfeeding (89%). Eighty-nine percent of women were asked about vaginal bleeding. Only 6% reported becoming ill with COVID-19 (**Table 9.3.1**).

Among all women age 15–49 with a live birth in the 2 years preceding the survey, 81% had their blood pressure measured, had a urine sample taken, had a blood sample taken, and had the baby's heartbeat checked. Seventy-seven percent were counseled about their diet, 72% were counseled about breastfeeding,

and another 72% were asked about vaginal bleeding. Six percent of women reported becoming ill with COVID-19 (**Table 9.3.2**).

**Trends:** Among women who had a live birth or stillbirth in the 2 years preceding the survey and received ANC, the percentage who had a urine sample taken during ANC increased from 90% in 2012 to 99% in 2023. During the same period, the percentage of women who had a blood sample taken during ANC increased from 92% to 99% and the percentage who had their blood pressure measured increased from 94% to almost 100%.

### 9.2.1 Food or Cash Assistance and Iron-containing Supplementation during Pregnancy

Food and cash assistance programs provide assistance to pregnant and lactating women to support healthy diets and address malnutrition.

During pregnancy, women have higher micronutrients needs and are at risk of micronutrient deficiencies, including iron deficiency, which is a primary cause of anemia. Severe anemia can place the mother and the baby in danger through increased risk of blood loss during labor and increased risk of preterm delivery, low birth weight, and perinatal mortality (Haider et al. 2013). To help address maternal anemia, interventions provide iron tablets or syrup to pregnant women (WHO 2016c).

Women with a live birth or stillbirth in the 2 years preceding the survey, regardless of whether they attended ANC, were asked if they received cash assistance through the Adresnaya Socialnaya Pomosh program and if they took iron supplementation during their most recent pregnancy. Overall, 75% of women age 15–49 who had a live birth in the past 2 years took some form of iron supplementation, and 4% received food or cash assistance.

Among women who took iron supplements, 55% took them for less than 60 days, 7% for 60–89 days, and 11% for 90–179 days. Less than 1% of women took supplements for more than 180 days (**Table 9.4**).

### 9.2.2 Source of Iron-containing Supplements

Information on sources of iron-containing supplements can increase understanding of the distribution patterns of supplements.

Among women age 15–49 who took some form of iron supplementation during the pregnancy of their most recent live birth, 67% obtained supplements from a private medical sector source and 37% from the public sector. Pharmacies (67%) were the most common private source of iron-containing supplements, while health centers (urban/rayon/rural) (32%) were the most common public sector source (**Table 9.5**).

### 9.2.3 Folic Acid Supplementation

Women with a live birth or stillbirth in the 2 years preceding the survey, regardless of whether they attended ANC, were also asked if they took folic acid tablets during the first 3 months of pregnancy. Overall, 74% of women age 15–49 who had a live birth in the past 2 years took folic acid during the first 3 months of pregnancy (**Table 9.4**).

Women with a live birth or stillbirth in the 2 years preceding the survey were also asked if they took folic acid supplementation before the pregnancy of their most recent live birth or stillbirth. Overall, 68% of women age 15–49 who had a live birth reported that they took folic acid before their pregnancy (**Table 9.6**).

## 9.3 COVID-19 DURING PREGNANCY

Pregnant women with COVID-19 are at increased risk of becoming seriously ill, which can lead to pregnancy problems such as preterm births (Gholami et al. 2023; Wei et al. 2021).

In the 2023 TjDHS, information on COVID-19 was collected from all women who had a pregnancy in the 35 months preceding the survey. **Table 9.7** shows the percentage of women age 15–49 with a pregnancy in the 2 years preceding the survey who reported that they became ill with COVID-19 during their most recent pregnancy.

Among women with a pregnancy in the 2 years preceding the survey, 6% reported that they became ill with COVID-19 during their most recent pregnancy resulting in a live birth, and 7% reported that they became ill during their most recent pregnancy resulting in a miscarriage or abortion (**Table 9.7**).

### Patterns by background characteristics

- A higher percentage of women in urban areas (8%) than rural areas (5%) reported that they became ill with COVID-19 during the pregnancy for their most recent live birth.
- The percentage of women reporting COVID-19 during pregnancy is highest in Dushanbe (13%) and lowest in GBAO (3%).
- A higher percentage of women in the highest wealth quintile (10%) than in the other wealth quintiles (4%–6%) reported COVID-19 during pregnancy.

## 9.4 DELIVERY SERVICES

### 9.4.1 Institutional Deliveries

#### Institutional deliveries

Deliveries that occur in a health facility.

**Sample:** All live births and/or stillbirths in the 2 years before the survey

Ninety-five percent of live births in the 2 years preceding the survey were delivered in a health facility, of which nearly all (95%) were delivered in a public facility. Less than 1% of births were delivered in a private facility, and 5% were delivered at home (**Table 9.8**).

**Trends:** Institutional deliveries increased substantially from 78% in 2012 to 95% in 2023. Over the same period, home deliveries declined from 22% to 5% (**Figure 9.2**).

### Patterns by background characteristics

- A higher percentage of births to mothers with at least four ANC visits were delivered in health facilities (96%) than births to mothers with no ANC visits (90%) (**Table 9.8**).
- The percentage of births occurring in a health facility increases with increasing mother's education and household wealth. Eighty-six percent of births to mothers with no education or a primary education

**Figure 9.2 Trends in place of birth**

and mothers in the lowest wealth quintile were delivered in health facilities, as compared with 99% of births to mothers with a higher education and mothers in the highest wealth quintile.

- By region, the percentage of live births delivered at a health facility ranges from 87% in Districts of Republican Subordination (DRS) to 99% in Dushanbe (**Map 9.1**).

### Map 9.1 Births delivered in a health facility by region

Percentage of live births in the 2 years before the survey that were delivered in a health facility

### 9.4.2 Delivery by Cesarean

Ten percent of live births in the 2 years preceding the survey were delivered via cesarean section (C-section) (**Table 9.9**).

**Trends:** The percentage of live births delivered via C-section increased from 5% in 2012 to 10% in 2023.

#### Patterns by background characteristics

- The percentage of C-section deliveries increases with increasing mother's age, from 4% among women under age 20 to 14% among women age 35–49 (**Figure 9.3**).
- C-section deliveries vary slightly with birth order, ranging from 9% for first-order births to 12% for fourth- and fifth-order births (**Table 9.9**).
- The percentage of C-sections is higher in urban areas (13%) than in rural areas (10%).

### Figure 9.3 Cesarean section by mother's age at birth

Percentage of live births in the 2 years before the survey that were delivered by cesarean section

### 9.4.3 Skilled Assistance during Delivery

#### Skilled assistance during delivery

Births delivered with the assistance of doctors (including family doctors, obstetricians, and gynecologists) and nurses/male nurses/midwives.

**Sample:** All live births and/or stillbirths in the 2 years before the survey

Obstetric care from a health professional during delivery is recognized as a critical element in managing complications that may arise during childbirth and reducing maternal and neonatal mortality.

The aim of the Tajikistan National Development Strategy is for 96% of births to be attended by a skilled provider by 2025. Overall, 98% of live births in the 2 years preceding the survey were delivered by a skilled provider. Of those births, 86% were delivered by obstetricians or gynecologists, 7% by nurses or midwives, and 3% by family doctors (Table 9.10 and Figure 9.4).

Sixty-eight percent of infants had skin-to-skin contact with their mother immediately after birth, as recommended.

**Trends:** The percentage of live births delivered by a skilled provider increased from 88% in 2012 to 98% in 2023.

**Figure 9.4 Assistance at delivery**

Percent distribution of births in the 2 years before the survey

#### Duration of Stay at Health Facility

Twenty-nine percent of women with vaginal births in the 2 years preceding the survey stayed in the health facility for 1–2 days after their delivery, and 68% stayed for 3 or more days. Seventeen percent of women who delivered via C-section stayed for 1–2 days after their delivery, while 80% stayed for 3 or more days (Table 9.11).

## 9.5 POSTNATAL CARE

### 9.5.1 Postnatal Health Check for Mothers

Overall, 89% of women received a postnatal care (PNC) check during the first 2 days after the delivery of their most recent live birth, with 75% receiving a postnatal check within 4 hours of delivery (Table 9.12). Six percent of women did not receive any postnatal check during the first 2 days after the delivery of their most recent live birth in the 2 years preceding the survey.

**Trends:** The percentage of women who received their first postnatal check in the first 2 days after birth increased from 80% in 2012 to 92% in 2017 before decreasing to 89% in 2023.

### Patterns by background characteristics

- Ninety-one percent of women who delivered in a health facility received a postnatal check during the first 2 days after birth, as compared with 54% of women who delivered elsewhere (Figure 9.5).
- The percentage of women who had a postnatal check during the first 2 days following birth varies by region, from 82% in Dushanbe to 94% in Sughd.
- The percentage of women with a postnatal check during the first 2 days after birth decreases from 96% among those less than age 20 to 89% among those age 20–49.

**Figure 9.5 Postnatal care by place of delivery**

### Type of Provider

Most women who gave birth in the 2 years before the survey (89%) received a postnatal check in the first 2 days after their most recent live birth from doctors, nurses, or midwives (Table 9.13). The check was most often conducted by a doctor (56% by an obstetrician/gynecologist, 2% by a family doctor, and 13% by another doctor). Eighteen percent of women received a check from a nurse or midwife. Nurses and midwives are particularly active in Sughd (20%) and Khatlon (26%). Less than 1% of women received a postnatal check from a traditional birth attendant, and 11% did not receive a postnatal check during the first 2 days after birth (Table 9.13).

### Content of Care

Ninety-three percent of women with a live birth in the 2 years preceding the survey had their blood pressure checked, 90% were asked about vaginal bleeding, and 80% were counseled about family planning during the first 2 days after birth by a health care provider. Overall, 79% of women had all three checks performed by a health care provider in the first 2 days after birth (Table 9.14).

## 9.5.2 Postnatal Health Check for Newborns

Eighty-five percent of newborns had a postnatal check during the first 2 days after birth. Most postnatal checks (61%) took place 1–3 hours after birth, and 10% took place less than 1 hour after delivery. Nine percent of newborns had no postnatal check (Table 9.15).

### Patterns by background characteristics

- Eighty-seven percent of newborns who were delivered in a health facility received a postnatal check during the first 2 days after birth, as compared with 57% of newborns who were delivered elsewhere (Figure 9.5).
- The percentage of newborns who had a postnatal check during the first 2 days following birth varies by region, from 74% in Dushanbe to 89% in GBAO.

### Type of Provider

Most newborns (85%) received a postnatal check within the first 2 days from a doctor, nurse, or midwife. The check was most often conducted by a doctor (9% by an obstetrician/gynecologist, 2% by a family

doctor, and 57% by another doctor). Sixteen percent of newborns received a check from a nurse or midwife, and less than 1% received a check from a traditional birth attendant (**Table 9.16**).

### *Content of Care*

The five recommended signal functions to be performed as part of postnatal care are (1) examining the umbilical cord, (2) measuring temperature, (3) observing and/or counseling on breastfeeding, (4) telling the mother about danger signs and how to recognize if the baby needs immediate attention, and (5) weighing the newborn. Overall, 77% of newborns had all five signal functions performed during the first 2 days after birth (**Table 9.17**). Of the selected signal functions performed during the first 2 days after birth, weighing the newborn was the most common (96%), while informing the mother about danger signs and how to recognize if the baby needs immediate attention was the least common (81%).

Postnatal breastfeeding counseling supports exclusive breastfeeding. Face-to-face breastfeeding counseling facilitates observation of positioning and the latch of the infant and allows for tailored breastfeeding counseling and support (WHO 2018). Ninety percent of mothers with a live birth in the 2 years preceding the survey reported that they were counseled on breastfeeding during the first 2 days after birth, and 85% reported that they were observed breastfeeding.

### **9.5.3 Postnatal Health Checks for Mothers and Newborns**

Eighty-nine percent of mothers and 85% of newborns received a postnatal check during the first 2 days after birth. In 82% of live births in the 2 years preceding the survey, both the mother and the newborn received a check.

The percentages of mothers and newborns receiving a postnatal check during the first 2 days after birth are higher when the birth took place in a health facility (91% and 87%, respectively) than when the birth took place elsewhere (54% and 57%, respectively) (**Figure 9.5** and **Table 9.18**).

## **9.6 BREAST AND CERVICAL CANCER EXAMINATIONS**

### **Breast cancer examination**

Women were asked if a doctor or other health care provider examined their breasts to check for cancer. The examination could include either a clinical breast exam, in which health care providers use their hands to feel for lumps or other changes, or use of medical equipment to make an image of the breast tissue, such as a mammogram.

### **Cervical cancer examination**

To be checked for cervical cancer, a woman is asked to lie on her back with her legs apart. Then the health care worker uses a brush or swab to collect a sample from inside the woman's cervix. The sample is sent to a laboratory for testing. This test is called a Pap smear or human papillomavirus (HPV) test. Another method is visual inspection with acetic acid (VIA). In this test, the health care worker puts vinegar on the cervix to see if there is a reaction. Women were asked if a doctor or other health care provider ever tested them for cervical cancer. Information on the type of screening test was not collected.

**Sample:** Women age 15–49

Six percent of women age 15–49 have ever been examined by a doctor or health care worker for breast cancer, and 9% have ever been tested for cervical cancer. Across regions, the percentage of women ever examined for breast cancer ranges from 4% in DRS to 12% each in Dushanbe and GBAO. The percentage of women ever tested for cervical cancer ranges from 8% in Sughd to 16% in GBAO (Table 9.19). The percentage of women who were ever examined for breast cancer and cervical cancer increases with increasing household wealth (Figure 9.6).

**Figure 9.6 Breast and cervical cancer exams by household wealth**

*Percentage of women age 15–49 who were ever examined by a health care worker for:*

■ Breast cancer ■ Cervical cancer

## 9.7 PROBLEMS IN ACCESSING HEALTH CARE

### Problems in accessing health care

Women were asked whether each of the following factors is a big problem in seeking medical advice or treatment for themselves when they are sick:

- Getting permission to go to the doctor
- Getting money for advice or treatment
- Distance to a health facility
- Not wanting to go alone

**Sample:** Women age 15–49

Among women age 15–49, only 17% reported that they had at least one problem accessing health care for themselves when they were sick. The most common problem was getting money for treatment (12%), followed by not wanting to go alone (7%). The percentage of women with at least one problem accessing health care varies by region, from 13% in Khatlon to 30% in Dushanbe (Table 9.20).

**Trends:** The percentage of women reporting at least one problem accessing health care decreased from 55% in 2012 to 17% in 2023.

## 9.8 DISTANCE AND MEANS OF TRANSPORT TO THE NEAREST HEALTH FACILITY

Seventy-four percent of women age 15–49 reported that the travel time from their home to the nearest health facility is less than 30 minutes. Only 4% indicated that their travel time is 1 hour or more. Twenty-six percent of women use motorized transportation to travel to the nearest health facility, while 74% use nonmotorized transport (Table 9.21).

## LIST OF TABLES

For more information on maternal and newborn health care, see the following tables:

Note: If more than one source of ANC was mentioned, only the provider with the highest qualifications is considered in this tabulation. Stillbirths are fetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are fetal deaths in pregnancies lasting 7 or more months. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Skilled provider includes family doctor, obstetrician/gynecologist, other doctor, nurse, male nurse, and midwife.

<sup>2</sup> Birth order refers to the order of the birth among the respondent's live births.

<sup>3</sup> For women who had both a live birth and a stillbirth in the 2 years preceding the survey, data are tabulated for the most recent birth only.

**Table 9.2 Number of antenatal care visits and timing of first visit**

Percent distribution of women age 15–49 who had a live birth and/or a stillbirth in the 2 years preceding the survey by number of antenatal care (ANC) visits during the pregnancy for the most recent live birth or stillbirth and by the timing of the first visit, and among women with ANC, median months pregnant at first visit, according to background characteristics, Tajikistan DHS 2023

| Background characteristic                | Number of ANC visits |       |       |       |        |       |            | 4+ ANC visits | Number of months pregnant at time of first ANC visit |        |        |        |            |       |       | Total | Number of women | Median months pregnant at first visit (for those with ANC) | Number of women with ANC |

Note: Stillbirths are fetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are fetal deaths in pregnancies lasting 7 or more months. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Birth order refers to the order of the birth among the respondent's live births.

<sup>2</sup> For women who had both a live birth and a stillbirth in the 2 years preceding the survey, data are tabulated for the most recent birth only.

**Table 9.3.1 Components of antenatal care among women receiving ANC**

Among women age 15–49 receiving antenatal care (ANC) for the most recent live birth and/or stillbirth in the 2 years preceding the survey, percentage receiving specific antenatal services from a health care provider and percentage who became ill with COVID-19, according to background characteristics, Tajikistan DHS 2023

| Background characteristic                | Among women who received antenatal care for their most recent live birth or stillbirth in the past 2 years, percentage who received specific services during ANC from a health care provider and percentage who reported that they became ill with COVID-19: |                    |                    |                          |                               |                               |                              |                          | Number of women with ANC for their most recent live birth and/or stillbirth in the past 2 years |

Note: The denominator for this table includes all women with a birth in the 2 years preceding the survey who received ANC for that birth. Stillbirths are fetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are fetal deaths in pregnancies lasting 7 or more months. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Birth order refers to the order of the birth among the respondent's live births.

<sup>2</sup> For women who had both a live birth and a stillbirth in the 2 years preceding the survey, data are tabulated for the most recent birth only.

**Table 9.3.2 Components of antenatal care among all women**

Among all women age 15–49 with a live birth and/or stillbirth in the 2 years preceding the survey, percentage receiving specific antenatal services from a health care provider for their most recent live birth and/or stillbirth and percentage who reported becoming ill with COVID-19 during the pregnancy for their most recent live birth and/or stillbirth, according to background characteristics, Tajikistan DHS 2023

| Background characteristic                | Percentage who received specific services during ANC from a health care provider for their most recent live or stillbirth: |                    |                    |                          |                               |                               |                              | Percentage who became ill with COVID-19 during the pregnancy for their most recent live birth or stillbirth | Number of women with a live birth and/or stillbirth in the past 2 years |

Note: The denominator for this table includes all women with a birth in the 2 years preceding the survey, whether or not they received ANC for that birth. Stillbirths are fetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are fetal deaths in pregnancies lasting 7 or more months. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Birth order refers to the order of the birth among the respondent's live births.

<sup>2</sup> For women who had both a live birth and a stillbirth in the 2 years preceding the survey, data are tabulated for the most recent birth only.

**Table 9.4 Food/cash assistance, folic acid supplementation, and iron-containing supplementation during pregnancy**

Among women age 15–49 with a live birth or stillbirth in the 2 years preceding the survey, percentages who received food or cash assistance, took folic acid during the first 3 months of pregnancy, and took any iron-containing supplements during the pregnancy of the most recent live birth or stillbirth, and percent distribution of the number of days during which women age 15–49 with a live birth or stillbirth in the 2 years preceding the survey took iron-containing supplements during the pregnancy for the most recent live birth or stillbirth, according to background characteristics, Tajikistan DHS 2023

| Background characteristic                | Among women with a live birth and/or stillbirth in the past 2 years, percentage who during the pregnancy for the most recent live birth or stillbirth: |                                                                |                                                   | Number of days during which women with a live birth and/or stillbirth in the past 2 years took iron-containing supplements <sup>2</sup> during the pregnancy for the most recent live birth or stillbirth: |        |       |        |       |            | Total | Number of women with a live birth and/or stillbirth in the past 2 years |

Note: Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> For women who had both a live birth and a stillbirth in the 2 years preceding the survey, data are tabulated for the most recent birth only.

<sup>2</sup> Birth order refers to the order of birth among the respondent's live births.

**Table 9.7 COVID during pregnancy**

Among all women age 15–49 with a pregnancy in the 2 years preceding the survey, percentage who reported becoming ill with COVID-19 during their most recent pregnancy, according to pregnancy outcome and background characteristics, Tajikistan DHS 2023

| Background characteristic                      | Percentage who reported becoming ill with COVID-19 during their most recent pregnancy | Number of women with a pregnancy in the past 2 years |

Note: The denominator for this table includes all women with a pregnancy in the 2 years preceding the survey, whether or not they received ANC for that birth. Stillbirths are fetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are fetal deaths in pregnancies lasting 7 or more months. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Birth order refers to the order of the birth among the respondent's live births.

<sup>2</sup> For women who had both a live birth and a stillbirth in the 2 years preceding the survey, data are tabulated for the most recent birth only.

**Table 9.8 Place of delivery**

Percent distribution of live births and/or stillbirths in the 2 years preceding the survey by place of delivery and percentage delivered in a health facility, according to background characteristics, Tajikistan DHS 2023

| Background characteristic          | Health facility |                | Home   | Other | Total | Percentage delivered in a health facility | Number of births |

Note: Stillbirths are fetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are fetal deaths in pregnancies lasting 7 or more months. Total includes 2 births for which the number of antenatal care visits was not known or missing. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Birth order refers to the order of the birth among the respondent's live births.

<sup>2</sup> Includes only the most recent birth in the 2 years preceding the survey

**Table 9.9 Cesarean section**

Percentage of live births and/or stillbirths in the 2 years preceding the survey delivered via cesarean section (C-section), according to background characteristics, Tajikistan DHS 2023

| Background characteristic                | Percentage delivered via C-section | Number of births |

Note: The question on C-section is asked only of women who delivered in a health facility. In this table, it is assumed that women who did not give birth in a health facility did not receive a C-section. Stillbirths are fetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are fetal deaths in pregnancies lasting 7 or more months. Total includes 2 births for which the number of antenatal care visits was not known or missing. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Birth order refers to the order of the birth among the respondent's live births.

<sup>2</sup> Includes only the most recent birth in the 2 years preceding the survey

**Table 9.10 Assistance during delivery**

Percent distribution of live births and/or stillbirths in the 2 years preceding the survey by person providing assistance during delivery and percentage assisted by a skilled provider, and among most recent live births in the 2 years preceding the survey, percentage with skin-to-skin contact immediately after birth, according to background characteristics, Tajikistan DHS 2023

| Background characteristic                | Person providing assistance during delivery |                                         |                 |                   |                                     |                    |        |       | Percent-<br>age delivered<br>by a<br>skilled<br>provider <sup>1</sup> | Number<br>of live<br>births<br>and/or<br>stillbirths | Among most recent<br>live births                                                       |                             |

Note: If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this tabulation. Stillbirths are fetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are fetal deaths in pregnancies lasting 7 or more months. Total includes 2 births for which the number of antenatal care visits was not known or missing. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

na = not applicable

<sup>1</sup> Skilled provider includes a family doctor, obstetrician/gynecologist, other doctor, nurse, male nurse, and midwife.

<sup>2</sup> Birth order refers to the order of the birth among the respondent's live births.

<sup>3</sup> Includes only the most recent birth in the 2 years preceding the survey

**Table 9.11 Duration of stay in health facility after birth**

Among women with a live birth and/or stillbirth in the 2 years preceding the survey who delivered their most recent live birth in a health facility, percent distribution by duration of stay in the health facility following their most recent live birth, according to type of delivery, Tajikistan DHS 2023

| Type of delivery                         | <6 hours | 6–11 hours | 12–23 hours | 1–2 days | 3+ days | Total | Number of women |

Note: Stillbirths are fetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are fetal deaths in pregnancies lasting 7 or more months. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Includes women who received a check from a family doctor, obstetrician/gynecologist, other doctor, nurse, male nurse, midwife, or traditional birth attendant

<sup>2</sup> Includes women who received a check after 41 days

<sup>3</sup> Birth order refers to the order of the birth among the respondent's live births.

<sup>4</sup> For women who had both a live birth and a stillbirth in the 2 years preceding the survey, data are tabulated for the most recent birth only.

**Table 9.13 Type of provider of first postnatal check for the mother**

Among women age 15–49 with a live birth and/or stillbirth in the 2 years preceding the survey, percent distribution by type of provider for the mother's first postnatal health check during the 2 days after the most recent live birth, according to background characteristics, Tajikistan DHS 2023

| Background characteristic                | Type of health provider of mother's first postnatal check |                            |              |                |                             | No postnatal check during the first 2 days after birth | Total | Number of women |

Note: Stillbirths are fetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are fetal deaths in pregnancies lasting 7 or more months. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Birth order refers to the order of the birth among the respondent's live births.

<sup>2</sup> For women who had both a live birth and a stillbirth in the 2 years preceding the survey, data are tabulated for the most recent birth only.

**Table 9.14 Content of postnatal care for the mother**

Among women age 15–49 with a live birth and/or stillbirth in the 2 years preceding the survey, percentage for whom selected checks were performed during the first 2 days after the most recent birth, according to background characteristics, Tajikistan DHS 2023

| Background characteristic                | Percentage for whom during the first 2 days after the most recent birth, any health care provider: |                            |                           | Percentage with all three checks performed in the first 2 days after birth | Number of women |
|------------------------------------------|----------------------------------------------------------------------------------------------------|----------------------------|---------------------------|----------------------------------------------------------------------------|-----------------|

Note: Stillbirths are fetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are fetal deaths in pregnancies lasting 7 or more months. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Birth order refers to the order of the birth among the respondent's live births.

<sup>2</sup> For women who had both a live birth and a stillbirth in the 2 years preceding the survey, data are tabulated for the most recent birth only.

**Table 9.15 Timing of first postnatal check for the newborn**

Percent distribution of most recent live births in the 2 years preceding the survey by time after birth of first postnatal check, and percentage of births with a postnatal check during the first 2 days after birth, according to background characteristics, Tajikistan DHS 2023

| Background characteristic      | Time after delivery of newborn's first postnatal check <sup>1</sup> |           |            |          |          |            | No postnatal check <sup>2</sup> | Total | Percentage of births with a postnatal check during the first 2 days after birth <sup>1</sup> | Number of births |

Note: Figures in parentheses are based on 25–49 unweighted cases.

<sup>1</sup> Includes newborns who received a check from a family doctor, obstetrician/gynecologist, other doctor, nurse, male nurse, midwife, or traditional birth attendant

<sup>2</sup> Includes newborns who received a check after the first week of life

<sup>3</sup> Birth order refers to the order of the birth among the respondent's live births.

**Table 9.16 Type of provider of first postnatal check for the newborn**

Percent distribution of most recent live births in the 2 years preceding the survey by type of provider of the newborn's first postnatal health check during the 2 days after the most recent live birth, according to background characteristics, Tajikistan DHS 2023

| Background characteristic      | Type of health provider of newborn's first postnatal check |                           |              |               |                             | No postnatal check during the first 2 days after birth | Total | Number of births |

Note: Figures in parentheses are based on 25–49 unweighted cases.

<sup>1</sup> Birth order refers to the order of the birth among the respondent's live births.

**Table 9.17 Content of postnatal care for newborns**

Among most recent live births in the 2 years preceding the survey, percentage for whom selected functions were performed during the first 2 days after birth and percentage with five signal functions performed during the first 2 days after birth, according to background characteristics, Tajikistan DHS 2023

| Background characteristic      | Percentage of most recent live births for whom a health care provider performed the selected functions during the first 2 days after birth: |                      |                                                                            |                                   |                               |                                                                   |                      | Percentage with five <sup>2</sup> signal functions performed during the first 2 days after birth | Number of births |

Note: Figures in parentheses are based on 25–49 unweighted cases.

<sup>1</sup> Captures newborns who were weighed “at birth.” May exclude some newborns who were weighed during the 2 days after birth.

<sup>2</sup> The functions are (1) examining the umbilical cord, (2) measuring temperature, (3) observing and/or counseling on breastfeeding, (4) telling the mother about danger signs/how to recognize if the baby needs immediate attention, and (5) weighing. Corresponds to the definition of the five signal functions to assess the content of postnatal care for newborns described in Moran et al. 2013.

<sup>3</sup> Birth order refers to the order of the birth among the respondent's live births.

**Table 9.18 Postnatal checks on mother and newborn**

Among most recent live births in the 2 years preceding the survey, percentage for which mothers age 15–49 received a postnatal check during the first 2 days after birth, percentage for which newborns received a postnatal check during the first 2 days after birth, percentage for which both mothers and newborns received a postnatal check, and percentage for which neither mothers nor newborns received a postnatal check, according to background characteristics, Tajikistan DHS 2023

| Background characteristic      | Percentage who received a postnatal check <sup>1</sup> during the first 2 days after birth |         |                         | Neither mother nor newborn received a postnatal check <sup>2</sup> | Number of births |

Note: Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Includes checks from a family doctor, obstetrician/gynecologist, other doctor, nurse, male nurse, midwife, or traditional birth attendant

<sup>2</sup> Includes checks after the first 2 days or by other persons

<sup>3</sup> Birth order refers to the order of the birth among the respondent's live births.

**Table 9.19 Examinations for breast and cervical cancer**

Percentage of women age 15–49 ever examined by a doctor or health care worker for breast cancer and percentage ever tested by a doctor or health care worker for cervical cancer, according to background characteristics, Tajikistan DHS 2023

| Background characteristic          | Percentage examined for breast cancer | Percentage tested for cervical cancer | Number of women |
|------------------------------------|---------------------------------------|---------------------------------------|-----------------|
| <b>Age</b>                         |                                       |                                       |                 |

## Key Findings

- **Vaccinations:** 94% of children age 12–23 months received any type of vaccine according to the national calendar of immunizations, and 71% of children age 24–35 months have been fully vaccinated with all basic antigens according to the national calendar of immunizations.
- **Symptoms of acute respiratory infection:** 2% of children under age 5 had symptoms of acute respiratory infection (ARI) in the 2 weeks preceding the survey. Advice or treatment was sought for 82% of children with ARI symptoms.
- **Fever:** 11% of children under age 5 had a fever in the 2 weeks preceding the survey. Among children with fever, 52% were taken for advice or treatment.
- **Diarrhea:** 16% of children under age 5 had diarrhea in the 2 weeks preceding the survey. Treatment or advice was sought for 64% of children with diarrhea.
- **Treatment of diarrhea:** 79% of children under age 5 with diarrhea in the 2 weeks preceding the survey received some form of oral rehydration therapy (ORT), while 2% received no treatment.

Information on child health and survival can help policymakers and program managers assess the efficacy of current strategies, formulate appropriate interventions to prevent deaths from childhood illnesses, and improve the health of children in Tajikistan.

This chapter presents information on birth weight and vaccination status for young children. It also looks at the prevalence of, and care-seeking behaviors for, three common childhood illnesses: symptoms of acute respiratory infection (ARI), fever, and diarrhea.

### 10.1 CHILD'S SIZE AND BIRTH WEIGHT

#### Low birth weight

Percentage of births with a reported birth weight below 2.5 kilograms regardless of gestational age.

**Sample:** Live births in the 2 years before the survey that have a reported birth weight, from either a written record or the mother's report

Birth weight is an indicator of a child's risk of malnutrition and neonatal death. It also is an indirect indicator of maternal nutritional status in the months prior to the child's birth. Data on birth weight were obtained for 96% of births in the 2 years preceding the survey from either a written record or the mother's recall. Among children with a reported birth weight, 6% weighed less than 2.5 kilograms at birth (**Table 10.1**).

The survey also collected information on the mother's estimate of the child's size at birth. Although birth size estimates provided by the mother are subjective, they have been shown to serve as a reasonable proxy for a child's birth weight. One percent of births in the 2 years preceding the survey were considered by mothers to be very small, 9% were reported as smaller than average, and 89% were reported to be average or larger than average (**Table 10.1**).

## 10.2 VACCINATION OF CHILDREN

Universal immunization of children against common vaccine-preventable diseases is crucial in reducing infant and child morbidity and mortality. In Tajikistan, routine childhood vaccines include bacille Calmette-Guérin (BCG) (tuberculosis); HepB (hepatitis B); oral polio vaccine (OPV); inactivated polio vaccine (IPV); DPT-containing vaccines such as DPT-HepB-Hib (diphtheria, pertussis, and tetanus; hepatitis B; and *Haemophilus influenzae* type b), DPT, DT, and Td; rotavirus vaccine (RV); and measles-containing vaccine such as measles-rubella (MR) or measles, mumps, and rubella (MMR). The MMR vaccine replaced the MR vaccine in November 2020. A second dose of inactivated polio vaccine (IPV 2) given at age 9 months was introduced into the national childhood immunization schedule in July 2022, and a pneumococcal conjugate vaccine (PCV) given at age 2, 4, and 12 months was added in November 2022. Of the 11 types of vaccines currently used in the national calendar of immunizations, within the framework of the 2023 TjDHS, immunization coverage data were collected for nine vaccines: BCG, HepB, DPT-HepB-Hib, OPV, IPV, pneumococcal, rotavirus, MR/MMR, and DPT.

In the 2023 TjDHS, information on vaccination coverage for children age 0–35 months was obtained in three overlapping ways: from vaccination cards available at home, from mothers' verbal reports, and from vaccination records maintained at a health facility. For each child born in the 3 years before the survey, mothers were asked to show the interviewer the vaccination passport or other document used for recording the child's immunizations. If the vaccination passport or other document was available, the interviewer copied the dates of each vaccination received. If the mother was not able to present the vaccination passport or other document for a child, she was asked to recall whether the child had received the BCG, hepatitis B birth dose, OPV, IPV, DPT-HepB-Hib, DPT 4, pneumococcal, rotavirus, and measles-containing vaccines. If she indicated that the child had received any of the multidose vaccines, she was asked the number of doses the child received. In Tajikistan, written vaccination records are usually maintained in local health facilities and are only rarely found in the home. Thus, in an effort to increase the information obtained from written records, the TjDHS team supervisor also went to the local health clinic after all interviews were completed in the cluster to record vaccination data from the MoHSPP vaccination forms or development health cards of children whose mothers agreed to allow their child's vaccination records to be reviewed.

### 10.2.1 Vaccination Card Ownership and Availability

Vaccination cards are a critical tool in ensuring that a child receives all recommended vaccinations on schedule. Among children age 12–23 months and age 24–35 months, 97% and 96%, respectively, ever had a vaccination card or other document on which their vaccinations were recorded (**Table 10.2**). The 2023 TjDHS field staff ultimately viewed the records for most children (82% of children age 12–23 months and 79% of children age 24–35 months) either in the home or at a health facility.

## 10.2.2 Vaccination Coverage according to a Vaccination Card or the Mother's Report

The majority of children age 12–23 months (94%) received any type of vaccine according to the national calendar of immunizations at any time before the survey (according to a vaccination card or the mother's report), while 6% of children received no vaccinations (**Figure 10.1**, **Table 10.3**, and **Table 10.4**).

According to a vaccination card or the mother's report, 94% of children age 12–23 months received the BCG vaccine, 81% received three doses of DPT-HepB-Hib, and 80% received three doses of polio vaccine (excluding the polio vaccine given at birth). Eighty percent of children age 24–35 months received one dose of measles-containing vaccine (MR or MMR), 71% received DPT 4, and 72% received a fifth dose of polio vaccine (OPV 4) (**Figure 10.1**). The percentages of children who received IPV 2 and PCV 1–3 are low because these vaccines were only recently introduced into the national calendar of immunizations, and many children in both age groups were too old to receive them.

According to MoHSPP annual statistical data, coverage of target population groups with any antigen is above 95%. It should be noted that, according to the 2023 TjDHS data based only on a vaccination card, almost all children age 12–23 months (more than 99%) whose vaccination cards were seen received any type of vaccine at any time before the survey (**Table 10.3** and **Table 10.4**).

**Figure 10.1 Childhood vaccinations**

### 10.2.3 Basic Antigen Coverage

#### Fully vaccinated: basic antigens

Percentage of children who received specific vaccines before the survey (according to a vaccination card or the mother's report). To have received all basic antigens, a child must receive at least:

- One dose of BCG vaccine, which protects against tuberculosis
- Three doses of polio vaccine given as oral polio vaccine (OPV), inactivated polio vaccine (IPV), or a combination of OPV and IPV
- Three doses of DPT-containing vaccine, which protects against diphtheria, pertussis (whooping cough), and tetanus
- One dose of measles-containing vaccine given as measles-rubella (MR) or measles, mumps, and rubella (MMR)

**Sample:** Children age 24–35 months<sup>1</sup>

Historically, an important measure of vaccination coverage has been the proportion of children receiving all “basic” antigens. Children are considered fully vaccinated against all basic antigens if they have received the BCG vaccine, three doses each of polio vaccine (given as OPV, IPV, or a combination of OPV and IPV) and DPT-containing vaccine, and a single dose of measles-containing vaccine. In Tajikistan, the BCG vaccine is usually given at birth or at first clinic contact, while the OPV (excluding the birth dose) and DPT-containing vaccines are given at approximately age 2, 3, and 4 months. IPV is given at age 3 and 9 months. A first measles-containing vaccination (MR or MMR) should be given in the second year of life (at or soon after age 12 months); therefore, data on coverage of all basic antigens are presented only for children age 24–35 months.

Seventy-one percent of children age 24–35 months have been fully vaccinated with basic antigens according to a vaccination card or the mother's report (**Table 10.3** and **Table 10.4**). It should be noted that, based on data from a vaccination card only, 87% of children age 24–35 months whose vaccination card was seen received all basic antigens (**Table 10.4**).

#### Patterns by background characteristics

- The percentage of children age 24–35 months who are fully vaccinated with basic antigens is higher among boys (73%) than among girls (67%) (**Table 10.4**).
- The percentage of children fully vaccinated with basic antigens increases from 70% for first-order births to 75% for fourth- and fifth-order births.
- The percentage of children fully vaccinated with basic antigens varies by region, from 51% in Districts of Republican Subordination (DRS) to 85% in Gorno-Badakhshan Autonomous Oblast (GBAO).

<sup>1</sup> Data on coverage of all basic antigens are not presented for children age 12–23 months because some of the children in that age group have only recently reached the age when the measles vaccine is recommended (12 months) and, thus, may not yet have received the MR or MMR vaccine.

## 10.2.4 National Schedule Coverage

### **Vaccinated according to national calendar of immunizations: age 12–23 months<sup>2</sup>**

Percentage of children who received specific vaccines before the survey (according to a vaccination card or the mother's report). According to the national calendar of immunizations, a child must receive the following:

- One dose of BCG vaccine
- Hepatitis B vaccine (birth dose)
- Four doses of OPV (birth dose and doses 1–3) and one dose of IPV<sup>2</sup>
- Three doses of DPT-HepB-Hib (pentavalent vaccine)
- Two doses of rotavirus vaccine

**Sample:** Children age 12–23 months

### **Vaccinated according to national calendar of immunizations: age 24–35 months<sup>3</sup>**

Percentage of children who received specific vaccines before the survey (according to a vaccination card or the mother's report). According to the national calendar of immunizations, a child must receive the vaccines listed for children age 12–23 months along with the following:

- One dose of measles and rubella (MR) or measles, mumps, and rubella (MMR)
- A fifth dose of OPV (OPV 4)
- DPT 4

**Sample:** Children age 24–35 months

A second measure of vaccination coverage is the percentage of children age 12–23 months and 24–35 months who are vaccinated according to the national calendar of immunizations.

### *Vaccinated According to the National Calendar of Immunizations: Age 12–23 Months*

In this report, a child age 12–23 months is considered to be vaccinated according to the national calendar of immunizations if the child has received the BCG vaccine, a birth dose of HepB vaccine, four doses of OPV (birth dose and doses 1–3), one dose of IPV, three doses of DPT-HepB-Hib (pentavalent vaccine), and two doses of rotavirus vaccine. Seventy-four percent of children age 12–23 months received these 12 vaccinations according to a vaccination card or the mother's report (**Table 10.3**).<sup>2</sup> It should be noted that, based on data from a vaccination card only, 88% of children age 12–23 months whose vaccination card was seen received the 12 vaccinations (**Table 10.4**).

<sup>2</sup> IPV 2 is excluded from the calculation of the indicator because it was introduced into the routine immunization schedule in July 2022, and therefore not all children for whom vaccination data were collected would have been eligible to receive it. Similarly, the first and second doses of the pneumococcal vaccine are excluded from the calculation because the vaccine was not introduced until November 2022, and not all children were eligible to receive it.

<sup>3</sup> IPV 2 and pneumococcal doses 1–3 are excluded from calculation because they were introduced into the routine immunization schedule in July and November 2022, respectively, and therefore not all children for whom vaccination data were collected would have been eligible to receive them.

### Patterns by background characteristics

- The percentage of children age 12–23 months who received 12 vaccinations according to a vaccination card or the mother’s report is higher in rural areas (76%) than in urban areas (67%) (**Table 10.4**).
- The percentage of children who received 12 vaccinations according to a vaccination card or the mother’s report ranges from 57% in DRS to 86% in Sughd.

### *Vaccinated According to the National Calendar of Immunizations: Age 24–35 Months*

In this report, children age 24–35 months are considered vaccinated according to the national calendar of immunization if they receive BCG, HepB (birth dose), three doses of DPT-HepB-Hib and a fourth dose of DPT, five doses of OPV (birth dose and doses 1–4), one dose of IPV, two doses of rotavirus vaccine, and one dose of MR or MMR. Sixty-three percent of children age 24–35 months received these 15 vaccinations according to a vaccination card or the mother’s report (**Table 10.3** and **Table 10.4**).<sup>3</sup> It should be noted that, based on data from a vaccination card only, 78% of children age 24–35 months whose vaccination card was seen received the 15 vaccinations (**Table 10.4**).

### Patterns by background characteristics

- The percentage of children age 24–35 months who received 15 vaccinations according to a vaccination card or the mother’s report is comparable across urban and rural areas (63% and 62%, respectively) but varies by region, ranging from 44% in DRS to 74% in Sughd (**Table 10.4**).
- The percentage of children who received 15 vaccinations according to a vaccination card or the mother’s report increases with increasing mother’s education, from 56% among those whose mothers have a general basic education to 70% among those whose mothers have a higher education.

### *Source of Vaccinations*

More than 99% of children age 12–23 months and all children age 24–35 months received vaccinations from public sector sources, predominantly health centers (**Table 10.5**).

## 10.3 SYMPTOMS OF ACUTE RESPIRATORY INFECTION AND CARE-SEEKING BEHAVIOR

Acute respiratory infection (predominantly pneumonia) is a common cause of death in young children. Caregivers are advised that a young child with a cough and/or difficult breathing should be taken to a health facility promptly.

### **Care seeking for symptoms of acute respiratory infection (ARI)**

Children with symptoms of ARI for whom advice or treatment was sought. ARI symptoms consist of short, rapid breathing that is chest-related and/or difficult breathing that is chest-related.

**Sample:** Children under age 5 with symptoms of ARI in the 2 weeks before the survey

Two percent of children under age 5 had symptoms of ARI in the 2 weeks preceding the survey (**Table 10.6**). Advice or treatment was sought for 82% of children with ARI symptoms, and advice or treatment was sought the same or next day for 53% of these children (data not shown separately).

#### *Source of Advice or Treatment for Symptoms of ARI*

Seventy-six percent of children with symptoms of ARI were taken to a health center (urban/rayon/rural) for advice or treatment (**Table 10.7**).

## **10.4 FEVER AND CARE-SEEKING BEHAVIOR**

Fever is a symptom of tuberculosis, typhoid fever, respiratory infections, diarrheal diseases, and other infectious diseases. **Table 10.8** shows the percentage of children under age 5 with a fever during the 2 weeks preceding the survey and the percentage receiving various treatments.

### **Care seeking for fever**

Children with fever for whom advice or treatment was sought.

**Sample:** Children under age 5 with a fever in the 2 weeks before the survey

Eleven percent of children under age 5 had a fever in the 2 weeks preceding the survey. Among children with fever, 52% were taken for advice or treatment, and advice or treatment was sought the same or next day for 37% of these children. Twenty-two percent of children with fever had blood taken from a finger or heel for testing, and 55% were given antibiotics (**Table 10.8**).

#### **Patterns by background characteristics**

- Fever was most often reported among children age 6–11 months (16%) and children living in Dushanbe and Sughd (17% each) (**Table 10.8**).
- The percentage of children with fever for whom advice or treatment was sought is higher in urban areas (62%) than in rural areas (47%).
- Advice or treatment for children with fever was sought most frequently in Dushanbe (68%) and least frequently in DRS (42%). Antibiotics were administered to children with fever most frequently in Khatlon (65%) and least frequently in DRS (40%). GBAO had too few reported cases of children with fever for care-seeking indicators to be shown.

#### *Source of Advice or Treatment for Fever*

Among children under age 5 with fever, treatment or advice was more frequently sought from the public sector (52%) than the private sector (1%), with health centers being the most common source (47%). Nearly all (99%) children for whom advice or treatment was sought were taken to public sector facilities, and 91% were taken to health centers (**Table 10.9**).

## 10.5 DIARRHEAL DISEASE

Diarrheal disease remains an important cause of morbidity and mortality among young children in Tajikistan—7% of children under age 5 who died in 2021 died due to diarrheal illness.<sup>†</sup> Oral rehydration therapy (ORT) and supplemental zinc, combined with continued feeding, are the recommended interventions for treating diarrhea. ORT can be provided as increased fluids (especially increased breastfeeding), as fluid prepared from a packet of oral rehydration salts (ORS), or as government-recommended homemade fluids (RHF). Zinc has been shown to reduce the severity and duration of diarrhea, and it is recommended that all children with diarrhea receive a 5-day course of zinc.

### 10.5.1 Diarrhea and Care-seeking Behavior

#### Care seeking for diarrhea

Children with diarrhea for whom advice or treatment was sought.

**Sample:** Children under age 5 with diarrhea in the 2 weeks before the survey

Sixteen percent of children under age 5 had diarrhea in the 2 weeks preceding the survey. Treatment or advice was sought for 64% of children with diarrhea (**Table 10.10** and **Figure 10.2**).

**Figure 10.2 Treatment of diarrhea**

Percentage of children under age 5 with diarrhea in the 2 weeks before the survey

<sup>†</sup> <https://data.unicef.org/topic/child-health/diarrhoeal-disease/>

## Patterns by background characteristics

- Diarrhea is most prevalent among children under age 2. Twenty-four percent of children age 6–11 months (when most children start solid foods) and 23% of children age 12–23 months had diarrhea in the 2 weeks before the survey. The latter age range corresponds to the time when children start losing protection from maternal antibodies through breastfeeding, begin to crawl and walk, and are at increased risk of contamination from food, water, and the environment. The prevalence of diarrhea steadily declines after children reach age 2, with 10% of children age 48–59 months having had diarrhea in the 2 weeks preceding the survey (**Figure 10.3**). Treatment was most commonly sought for children age 6–11 months (69%) and 12–23 months (70%).

**Figure 10.3 Diarrhea prevalence by age**

*Percentage of children under age 5 who had diarrhea in the 2 weeks before the survey*

- The prevalence of diarrhea is higher among children living in urban areas (20%) than among those living in rural areas (15%). Diarrhea prevalence is highest in Dushanbe (24%) and lowest in GBAO (10%).
- Thirty-one percent of children in households with unimproved drinking water sources had diarrhea in the 2 weeks preceding the survey, as compared with 16% of children in households with improved water sources. Interestingly, only 12% of children in households drinking surface water were reported as having diarrhea.
- Care seeking is higher in urban areas (69%) than in rural areas (62%). By region, care seeking is highest in Dushanbe (78%) and lowest in GBAO (31%) and DRS (58%). However, very few children in GBAO were reported to have diarrhea, so the estimate should be interpreted with caution.

### 10.5.2 Feeding Practices

#### **Appropriate feeding practices**

Children with diarrhea are given more liquids than usual and as much food or more than usual.

**Sample:** Children under age 5 with diarrhea in the 2 weeks before the survey

Dehydration from diarrhea is a major cause of malnutrition and mortality among young children. To reduce dehydration and minimize the effects of diarrhea on nutritional status, mothers are encouraged to increase the amount of fluids given to children during diarrheal episodes and to either increase feeding or at least continue normal feeding.

In Tajikistan, feeding practices during diarrheal episodes often deviate from these

recommendations. Only 31% of children under age 5 with diarrhea in the 2 weeks before the survey were given more liquids than usual, while 15% received the same amount of liquids. It is of concern that over half of children were given somewhat less (34%) or much less (20%) liquid than usual. Less than 1% were given no liquids at all. Only 26% of children with diarrhea were given the same amount of food or more food than usual. Seventy-four percent of children were given much less or somewhat less food than usual; less than 1% were given no food at all (**Figure 10.4** and **Table 10.11**).

**Figure 10.4 Feeding practices during diarrhea**

Note: Data do not add to 100% due to rounding.

### 10.5.3 Oral Rehydration Therapy, Zinc, Continued Feeding, and Other Treatments

#### Oral rehydration therapy

Children with diarrhea are given increased fluids, a fluid made from a special packet of oral rehydration salts (ORS), or government-recommended homemade fluids (RHF).

**Sample:** Children under age 5 with diarrhea in the 2 weeks before the survey

Seventy-nine percent of children under age 5 with diarrhea in the 2 weeks preceding the survey received ORT. Thirty-one percent of children received ORT in the form of increased fluids, 63% in ORS packets, and 23% as recommended home fluids (RHF) (**Table 10.11**, **Table 10.12**, and **Figure 10.2**). Twenty percent of children were given antibiotics and 55% received zinc, which can reduce the duration and severity of diarrhea. Only 2% of children received no treatment.

**Trends:** The percentage of children under age 5 with diarrhea in the 2 weeks before the survey who received ORT increased from 73% in 2017 to 79% in 2023.

## Patterns by background characteristics

- A higher percentage of children with diarrhea in urban areas (90%) than rural areas (74%) received ORT (**Table 10.12**).
- Treatment of diarrhea with ORT varies by region, ranging from 70% in DRS to 95% in Dushanbe.

### Source of Advice or Treatment for Diarrhea

Among children under age 5 with diarrhea, advice or treatment was more frequently sought from the public sector (63%) than the private sector (1%) (**Table 10.13**).

## 10.6 TREATMENT OF CHILDHOOD ILLNESS

Diarrhea was the most common illness among children under age 5 during the 2 weeks before the survey (16%), followed by fever (11%) and symptoms of ARI (2%) (**Figure 10.5**). Advice or treatment was sought for 82% of children with ARI symptoms, 64% of children with diarrhea, and 52% of children with a fever.

**Figure 10.5 Symptoms of childhood illness and care seeking**

## LIST OF TABLES

For more information on child health, see the following tables:

- **Table 10.1** Child's size and weight at birth
- **Table 10.2** Possession and observation of vaccination cards according to background characteristics
- **Table 10.3** Vaccinations by source of information
- **Table 10.4** Vaccinations by background characteristics
- **Table 10.5** Source of vaccinations
- **Table 10.6** Children with symptoms of ARI
- **Table 10.7** Source of advice or treatment for children with symptoms of ARI
- **Table 10.8** Children with fever and care seeking for fever
- **Table 10.9** Source of advice or treatment for children with fever
- **Table 10.10** Children with diarrhea and care seeking for diarrhea
- **Table 10.11** Feeding practices during diarrhea
- **Table 10.12** Oral rehydration salts, zinc, continued feeding, and other treatments for diarrhea
- **Table 10.13** Source of advice or treatment for children with diarrhea

**Table 10.1 Child's size and weight at birth**

Percent distribution of live births in the 2 years preceding the survey by mother's estimate of baby's size at birth, percentage of live births in the 2 years preceding the survey that have a reported birth weight by source of information (written record or mother's report), and among live births in the 2 years preceding the survey with a reported birth weight, percentage less than 2.5 kg, according to background characteristics, Tajikistan DHS 2023

| Background characteristic   | Percent distribution of births by size of baby at birth based on mother's estimate |                      |                   |            |       | Percentage of births that have a reported birth weight according to: |                 |        |                  | Among births with a reported birth weight <sup>1</sup> |                  |
|-----------------------------|------------------------------------------------------------------------------------|----------------------|-------------------|------------|-------|----------------------------------------------------------------------|-----------------|--------|------------------|--------------------------------------------------------|------------------|
|                             | Very small                                                                         | Smaller than average | Average or larger | Don't know | Total | Written record                                                       | Mother's report | Either | Number of births | Percent-age less than 2.5 kg                           | Number of births |
| Mother's age at birth       |                                                                                    |                      |                   |            |       |                                                                      |                 |        |                  |                                                        |                  |
| <20                         | 0.0                                                                                | 10.8                 | 88.5              | 0.7        | 100.0 | 15.2                                                                 | 84.1            | 99.3   | 151              | 10.1                                                   | 150              |

na = not applicable

BCG = bacille Calmette-Guérin; DPT = diphtheria-pertussis-tetanus; HepB = hepatitis B; Hib = *Haemophilus influenzae* type b; IPV = inactivated polio vaccine; OPV = oral polio vaccine; MR = measles and rubella

MMR = measles, mumps and rubella

<sup>1</sup> Facility-based vaccination card or record, child development card, or home-based vaccination passport

<sup>2</sup> Children are considered to have received HepB (birth dose) if it was recorded on their card or reported by their mother, regardless of timing.

<sup>3</sup> IPV 2 given at age 9 months was introduced in July 2022. Not all children age 12–23 months at the time of the interview would have been eligible for IPV 2. For example, a child who was age 23 months in October 2023 would have been too old to receive the vaccine when it was rolled out in 2022.

<sup>4</sup> Pneumococcal vaccine was introduced in 2022. The estimates are low because doses 1 (given at 2 months) and 2 (given at 4 months) were not available until November 2022 and January 2023, respectively, and many children age 12–23 months would have been too old to receive them.

<sup>5</sup> BCG, three doses of DPT-containing vaccine, three doses of polio vaccine (excluding polio vaccine given at birth), and one dose of MR or MMR. Data on coverage of all basic antigens are not presented for children age 12–23 months because children who had just turned age 12 months at the time of data collection would have only recently been eligible to receive MR/MMR.

<sup>6</sup> For children age 12–23 months, there are 12 recommended vaccinations: BCG, HepB (birth dose), three doses of DPT-HepB-Hib, four doses of oral polio vaccine (OPV 0–3), one dose of IPV vaccine, and two doses of rotavirus vaccine. For children age 24–35 months, there are 15 recommended vaccinations: BCG, HepB (birth dose), three doses of DPT-HepB-Hib and a fourth dose of DPT, five doses of OPV (0–4), one dose of IPV vaccine, two doses of rotavirus vaccine, and one dose of MR or MMR. The IPV 2 and pneumococcal vaccines are excluded from this indicator for both age groups because they were introduced into the routine immunization schedule for children in Tajikistan in July and November 2022, respectively. Thus, not all children for whom vaccination data were collected would have been eligible to receive these vaccinations.

**Table 10.4 Vaccinations by background characteristics**

Percentage of children age 12–23 months and children age 24–35 months who received specific vaccines before the survey (according to a vaccination card kept at home or in a health facility or the mother's report), percentage who received any vaccinations, percentage who received specified numbers of vaccinations according to the national calendar of immunizations, percentage who received no vaccinations, and percentage fully vaccinated (basic antigens), according to background characteristics, Tajikistan DHS 2023

Note: Children are considered to have received the vaccine if it was either written on the child's vaccination card or reported by the mother. For children whose vaccination information is based on the mother's report, date of vaccination is not collected. The proportions of vaccinations given during the first and second years of life are assumed to be the same as for children with a written record of vaccination. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

BCG = bacille Calmette-Guérin; DPT = diphtheria-pertussis-tetanus; HepB = hepatitis B; Hib = *Haemophilus influenzae* type b; OPV = oral polio vaccine; IPV = inactivated polio vaccine; MR = measles and rubella; MMR = measles, mumps, and rubella

<sup>1</sup> Children are considered to have received HepB (birth dose) if it was recorded on their card or reported by their mother, regardless of timing.

<sup>2</sup> OPV 0 is the polio vaccination given at birth.

<sup>3</sup> IPV 2 given at age 9 months was introduced in July 2022. Not all children age 12–23 months at the time of the interview would have been eligible for IPV 2. For example, a child who was age 23 months in October 2023 would have been too old to receive the vaccine when it was rolled out in 2022.

<sup>4</sup> Pneumococcal vaccine was introduced in 2022. The estimates are low because doses 1 (given at 2 months) and 2 (given at 4 months) were not available until November 2022 and January 2023, respectively, and many children age 12–23 months would have been too old to receive them.

<sup>5</sup> For children age 12–23 months, there are 12 recommended vaccinations: BCG, HepB (birth dose), three doses of DPT-HepB-Hib, four doses of OPV (birth dose and doses 1–3), one dose of IPV, and two doses of rotavirus vaccine. The measles-containing vaccine is excluded from this indicator because in Tajikistan it is given in the second year of life (at 12 months). IPV 2 is excluded from the calculation of the indicator because it was introduced into the routine immunization schedule in July 2022, and therefore not all children for whom vaccination data were collected would have been eligible to receive it. Similarly, the first and second doses of the pneumococcal vaccine are excluded from the calculation because the vaccine was not introduced until November 2022, and not all children were eligible to receive it.

<sup>6</sup> Pneumococcal vaccine dose 3 was introduced in September 2023. The estimates are low because many children age 24–35 months would have been too old to receive it.

<sup>7</sup> BCG, three doses of the DPT-containing vaccine, three doses of polio vaccine (OPV, IPV, or a combination of OPV and IPV, excluding the polio vaccine given at birth), and one dose of MR or MMR.

<sup>8</sup> For children age 24–35 months, there are 15 recommended vaccinations: BCG, HepB (birth dose), three doses of DPT-HepB-Hib and a fourth dose of DPT 4, five doses of OPV (birth dose and doses 1–4), one dose of IPV, two doses of rotavirus vaccine, and one dose of MR or MMR. IPV 2 and pneumococcal vaccine doses 1–3 are excluded from the calculation because they were introduced into the routine immunization schedule for children in Tajikistan in July and November 2022, respectively, and therefore not all children for whom vaccination data were collected would have been eligible to receive them.

<sup>9</sup> Facility-based vaccination card or record, child development card, or home-based vaccination passport

**Table 10.5 Source of vaccinations**

Among children who received at least one vaccination, percent distribution of children age 12–23 months and children age 24–35 months by source of most vaccinations, according to background characteristics, Tajikistan DHS 2023

| Background characteristic   | Children age 12–23 months who received at least one vaccination <sup>1</sup> |                      |                             |                        |       |       |                                 | Children age 24–35 months who received at least one vaccination <sup>1</sup> |                      |                             |       |                                 |

Note: Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.  
<sup>1</sup> The source of most vaccinations was asked only if the child had any vaccinations recorded on the vaccination passport or other documents kept at home; thus, children who did not have vaccination passports or other documents kept at home were excluded from the table.

**Table 10.6 Children with symptoms of ARI**

Among children under age 5, percentage who had symptoms of acute respiratory infection (ARI) in the 2 weeks preceding the survey, according to background characteristics, Tajikistan DHS 2023

| Background characteristic              | Percentage with symptoms of ARI <sup>1</sup> | Number of children |

Note: It is recommended that children be given more liquids to drink during diarrhea and that food not be reduced. Figures in parentheses are based on 25–49 unweighted cases.

<sup>1</sup> Breastfeeding status is captured for children age 0–35 months only.

**Table 10.12 Oral rehydration salts, zinc, continued feeding, and other treatments for diarrhea**

Among children under age 5 who had diarrhea in the 2 weeks preceding the survey, percentage given fluid from an ORS packet; zinc; ORS and zinc; ORS and continued feeding; ORS, zinc, and continued feeding; ORS or increased fluids; recommended homemade fluids (RHF); oral rehydration therapy (ORT); ORT and continued feeding; and other treatments, and percentage given no treatment, according to background characteristics, Tajikistan DHS 2023

| Background characteristic     | Percentage of children with diarrhea who were given: |        |                    |                                                           |                                                                     |                                    |                                                      |                                                      |                                                           |                          |                            |                              |                          | Percent-<br>age<br>given no<br>treat-<br>ment | Number<br>of<br>children<br>with<br>diarrhea |

Note: Advice or treatment for children with diarrhea may have been sought from more than one source.

ORS = oral rehydration salts

<sup>1</sup> Fluids from ORS packet

## Key Findings

- **Nutritional status of children:** 14% of children under age 5 are stunted (too short for their age), 6% are wasted (too thin for their height), 5% are underweight (too thin for their age), and 5% are overweight or obese (too heavy for their height).
- **Growth monitoring:** 54% of children under age 5 had their weight measured in the 3 months prior to the survey, while 52% had their height measured.
- **Breastfeeding:** Among children age 0–23 months, 41% were put to the breast within 1 hour of birth and 78% were exclusively breastfed for the first 2 days after birth; 41% of children under age 6 months are exclusively breastfed.
- **Complementary feeding:** 28% of children age 6–23 months received the minimum number of food groups during the day or night preceding the interview, 30% were fed the minimum number of times, and 9% were fed a minimum acceptable diet. Sixty-five percent of children age 6–23 months were given sweet beverages, 35% were given unhealthy foods, and 56% were not given vegetables or fruits.
- **Anemia in women and children:** 35% of children age 6–59 months and 36% of women age 15–49 are classified as having anemia. The prevalence of anemia is 30% among pregnant women and 36% among young women age 15–19.
- **Nutritional status of women:** 50% of women age 20–49 are overweight or obese, and 3% are thin. Among young women age 15–19, 12% are overweight or obese and 11% are thin.
- **Women's dietary practices:** 87% of women age 15–49 consumed foods from at least five of 10 defined food groups during the day or night preceding the survey, 95% consumed sweet beverages, and 67% consumed unhealthy foods.

**N**utrition is the foundation for the health and development of children and adults. This chapter reports on nutritional status and anemia among children and women, infant and young child feeding (IYCF) practices, and women's dietary practices. In addition, the chapter presents key nutrition interventions including infant and young child feeding counseling, child growth monitoring, micronutrient supplementation, and the presence of iodine in household cooking salt. Chapter 9 presents information on nutritional interventions provided during the antenatal period such as maternal nutrition counseling, breastfeeding counseling, iron-containing supplementation and sources of the supplements, and postnatal breastfeeding counseling and observation. Chapter 10 presents information on child feeding practices during diarrhea.

## 11.1 NUTRITIONAL STATUS OF CHILDREN

Anthropometry is commonly used to measure child nutritional status. The anthropometric measurements are used to report on child growth indicators. The distribution of height and weight among children under age 5 was compared with the World Health Organization (WHO) Child Growth Standards reference population (WHO 2006b). The distribution of a well-nourished population will be similar to that of the reference population, while the distribution of a poorly nourished population will not. The indices height-for-age, weight-for-height, and weight-for-age can be expressed in standard deviation units ( $z$  scores) from the median of the reference population. Values that are greater than two standard deviations below the median of the WHO Child Growth Standards are used to define malnutrition.

Stunting, or low height-for-age, is a measure of growth faltering. Stunting is a marker of the deficient growth environment to which children have been exposed and reflects the overall well-being of a population (Perumal et al. 2018). Suboptimal nutrition can contribute to stunting, while other causes include recurrent infection, chronic diseases, and more; many of the causes of stunting are complex and unknown (WHO 2014a).

Wasting, or low weight-for-height, is a measure of acute undernutrition. It represents the failure to receive adequate nutrition in the period immediately before the survey. Wasting may result from inadequate food intake or from a recent episode of illness or infection causing weight loss.

Underweight, or low weight-for-age, is a composite index of weight-for-height and height-for-age. It reflects children who are stunted, wasted, or both.

Overweight, or high weight-for-height, results from an imbalance between energy consumed (too much) and energy expended (too little).

### **Stunting (assessed via height-for-age)**

Height-for-age is a measure of growth faltering. Children whose height-for-age  $z$  score is below minus two standard deviations ( $-2$  SD) from the median of the reference population are considered short for their age (stunted). Children whose  $z$  score is below minus three standard deviations ( $-3$  SD) from the median are considered severely stunted.

**Sample:** Children under age 5

### **Wasting (assessed via weight-for-height)**

The weight-for-height index measures body mass in relation to body height or length and describes acute undernutrition. Children whose weight-for-height  $z$  score is below minus two standard deviations ( $-2$  SD) from the median of the reference population are considered thin (wasted). Children whose  $z$  score is below minus three standard deviations ( $-3$  SD) from the median are considered severely wasted.

**Sample:** Children under age 5

### **Underweight (assessed via weight-for-age)**

Weight-for-age is a composite index of height-for-age and weight-for-height that takes into account both wasting and stunting. Children whose weight-for-age  $z$  score is below minus two standard deviations ( $-2$  SD) from the median of the reference population are classified as underweight. Children whose  $z$  score is below minus three standard deviations ( $-3$  SD) from the median are considered severely underweight.

**Sample:** Children under age 5

### Overweight (assessed via weight-for-height)

Children whose weight-for-height  $z$  score is more than two standard deviations (+2 SD) above the median of the reference population are considered overweight.

**Sample:** Children under age 5

The means of the  $z$  scores for height-for-age, weight-for-height, and weight-for-age are also calculated as summary statistics that represent the nutritional status of children in a population. The mean scores describe the nutritional status of the entire population of children without the use of a cutoff point. A mean  $z$  score of less than 0 (a negative mean value for stunting, wasting, or underweight) suggests a downward shift in the entire sample population's nutritional status relative to the reference population. The farther away mean  $z$  scores are from 0, the higher the prevalence of malnutrition.

### Child Growth Measures of Malnutrition

Information on anthropometry training, standardization, and data collection methodology can be found in Chapter 1. Appendix C, **Table C.7** provides the standardization results. The 2023 TjDHS identified a total of 5,040 children under age 5 who were eligible for height and weight measurements (Appendix C, **Table C.8**). During measurements, 3% of children had hairstyles or ornamentation that interfered with height measurement, and 5% of children were not minimally dressed or wore heavy permanent ornaments that interfered with weight measurement (Appendix C, **Table C.10**). Valid height-for-age measurements were obtained for 98% of eligible children, valid weight-for-height measurements were obtained for 98% of eligible children, and valid weight-for-age measurements were obtained for 98% of eligible children (Appendix C, **Table C.8**). Appendix C, **Table C.8** provides additional information on the completeness and quality of anthropometry data for children.

Data collection included remeasurement of children as described in Chapter 1. The calculation of final  $z$  scores was based on the first measurement among children randomly selected for remeasurement, while the calculation of final  $z$  scores was based on the second measurement among children flagged for remeasurement. The remeasurement completion rate was 100% among those selected for remeasurement. Appendix C, **Tables C.8–C.10** provide additional information on the completeness and quality of anthropometry data for children, remeasurement data, and interference of height and weight measurements from hairstyles or ornamentation and heavy clothing (WHO and UNICEF 2019).

**Table 11.1** shows the nutritional status of children under age 5 according to the three anthropometric indices. Fourteen percent of children under age 5 are stunted (too short for their age), and 4% are severely stunted. Six percent of children are wasted (too thin for their height), including 2% who are severely wasted. Five percent of children are underweight (too thin for their age), and 5% are overweight or obese.

**Trends:** A comparison of anthropometric measurements from previous TjDHS surveys generally shows improvements in the nutritional status of children under age 5 over the past decade. The prevalence of stunting declined from 26% in 2012 to 14% in 2023 (**Figure 11.1**). The percentage of children who are wasted and underweight followed a similar trend during the period, falling from 10% to 6% and from 12% to 5%, respectively. There have been only slight changes over the past decade in the percentage of children who are overweight (6% in 2012, 3% in 2017, and 5% in 2023).

**Figure 11.1 Trends in child growth measures**

Percentage of children under age 5 who are malnourished

### Patterns by background characteristics

- The prevalence of stunting, wasting, and underweight is higher among children residing in rural areas (15%, 7%, and 6%, respectively) than among those residing in urban areas (11%, 4%, and 4%, respectively), while the prevalence of overweight is the same in rural and urban areas (5%) (**Table 11.1**).
- Stunting varies from 14% to 16% in the four lowest quintiles and declines to 10% in the highest quintile. The opposite pattern is seen for overweight, which increases slightly from 3% in the lowest wealth quintile to 5% in the highest quintile.
- The prevalence of stunting is similar across regions (14%–15%) with the exception of Dushanbe, where the prevalence is 9% (**Map 11.1**).

**Map 11.1 Stunting in children by region**

*Percentage of children under age 5 who are stunted*

## 11.2 GROWTH MONITORING AND PROMOTION

Growth monitoring and promotion programs include monitoring children's nutritional status through physical growth measurements and using this information to provide caregivers with counseling and referrals of children whose growth appears abnormal (WHO 2013; WHO 2017a). An important component of growth monitoring is regular measurement of children's weight, length/height, and/or mid-upper-arm circumference (MUAC).

**Weight measured in the past 3 months**

Percentage of children under age 5 who had their weight measured in the past 3 months.

**Weight and height measured in the past 3 months**

Percentage of children under age 5 who had their weight and height measured in the past 3 months.

**Mid-upper-arm circumference (MUAC) measured in the past 3 months**

Percentage of children under age 5 who had their MUAC measured in the past 3 months.

**Weight, height, and MUAC measured in the past 3 months**

Percentage of children under age 5 who had their weight, height, and MUAC measured in the past 3 months.

**Sample:** Children under age 5

Overall, 52% of children under age 5 had their weight and height measured by a health care provider in the 3 months before the survey. Fifty-four percent of children had their weight measured, 52% had height measurements taken, and 25% had their MUAC measured. Twenty-four percent of children had all three measurements taken (**Table 11.2**).

**Patterns by background characteristics**

- The percentage of children who had both their weight and height measured decreases with age, from 66% among those under age 6 months to 39% among those age 48–59 months (**Table 11.2**).
- There is wide variation by region in the percentage of children who had their weight, height, and MUAC measured. The percentage of children who had both their weight and height measured is lowest in Districts of Republican Subordination (DRS) (33%) and highest in Gorno-Badakhshan Autonomous Oblast (GBAO) (83%). The percentage of children with MUAC measurements is lowest in Sughd (13%) and highest in GBAO (76%).
- The percentage of children who had both weight and height measurements taken increases with increasing mother's education and household wealth.

**11.3 INFANT AND YOUNG CHILD FEEDING PRACTICES**

Optimal infant and young child feeding (IYCF) practices are critical to the health and survival of young children. Recommended IYCF practices include early initiation of breastfeeding (within the first hour after birth), exclusive breastfeeding for the first 2 days after birth, exclusive breastfeeding for the first 6 months of life, continued breastfeeding for 2 years or more, and introduction of safe, appropriate, and adequate complementary foods at age 6 months (WHO and UNICEF 2021). This section reports on IYCF indicators for children under age 2.

**11.3.1 Ever Breastfed, Early Initiation of Breastfeeding, and Exclusive Breastfeeding for the First 2 Days after Birth**

Breastfeeding supports children's growth and development and benefits mothers' health. Initiation of breastfeeding within the first hour of birth is important for both the mother and the child. The first breast milk contains colostrum, which is highly nutritious and has antibodies that protect the newborn from infections. Early initiation of breastfeeding also encourages bonding between the mother and her newborn, especially through skin-to-skin contact, which facilitates the production of breast milk. Feeding newborns anything other than breast milk in the first 2 days after birth can delay early initiation of breastfeeding and interrupt exclusive breastfeeding and is not recommended unless medically indicated (WHO and UNICEF 2021).

**Ever breastfed**

Percentage of children born in the past 2 years who were ever breastfed.

**Early initiation of breastfeeding**

Percentage of children born in the past 2 years who were put to the breast within 1 hour of birth.

**Exclusive breastfeeding for the first 2 days after birth**

Percentage of children born in the past 2 years who were fed exclusively with breast milk for the first 2 days after birth.

**Sample:** Children born in the past 2 years

Among children born in the 2 years preceding the survey, 97% were ever breastfed, 41% were put to the breast within the first hour after birth, and 78% were exclusively breastfed (given nothing other than breast milk to eat or drink) for the first 2 days after birth (**Table 11.3**).

**Patterns by background characteristics**

- Forty-two percent of children in rural areas were put to the breast within an hour after birth, as compared with 37% in urban areas (**Table 11.3**).
- Early initiation of breastfeeding varies greatly between regions; the lowest percentage is in Khatlon (25%) and the highest is in GBAO (72%).
- Early initiation of breastfeeding is higher among vaginal births (43%) than among cesarean section births (21%).
- Eighty-one percent of children whose mothers were counseled on breastfeeding during antenatal care (ANC) visits were exclusively breastfed for the first 2 days after birth, compared with 66% of children whose mothers did not receive any ANC.

**11.3.2 Exclusive Breastfeeding and Mixed Milk Feeding**

In the first 6 months, children should be exclusively breastfed; that is, they should be given nothing but breast milk. Exclusive breastfeeding for 6 months lowers the risk of infections that can lead to diarrhea and respiratory illnesses and provides all of the nutrients and liquid an infant requires for optimal growth and development. Mixed milk feeding, in which children are fed both breast milk and formula or animal milk within the first 6 months, has the adverse effect of reducing breast milk output because the production of breast milk is modulated by the frequency and intensity of suckling. Mixed feeding under age 6 months also can increase children's risk of diarrhea, alter their intestinal microflora, and lead to early cessation of breastfeeding (WHO and UNICEF 2021).

**Exclusive breastfeeding under 6 months**

Percentage of children age 0–5 months who were fed exclusively with breast milk during the previous day.

**Sample:** Youngest children age 0–5 months living with their mother

**Mixed milk feeding under 6 months**

Percentage of children age 0–5 months who were fed both breast milk and formula and/or animal milk during the previous day.

**Sample:** Youngest children age 0–5 months living with their mother

**Figure 11.2** shows the pattern of how children are fed in the first 6 months. At age 0–1 month, 69% of children are exclusively breastfed as per WHO recommendations. Thirty-one percent of children are not being fed according to recommended guidelines, with 13% receiving breast milk and plain water only and 11% receiving breast milk and infant formula and/or animal milk. By age 2–3 months, there is a substantial 31 percentage point decline in the percentage of children exclusively breastfed, with 63% of children receiving liquids or foods in

addition to breast milk or instead of breast milk. More children are receiving breast milk and plain water only (29%) and breast milk and animal milk and/or infant formula (23%) at 2–3 months than at the earliest age (0–1 month). By age 4–5 months, the percentage of children exclusively breastfed decreases to 18%, and more than 4 out of 5 children (82%) are receiving liquids or foods other than breast milk, primarily breast milk and animal milk and/or infant formula (29%) (**Table 11.4** and **Table 11.5**). Overall, 41% of children under age 6 months are exclusively breastfed, while 9% are not breastfed at all.

**Trends:** Exclusive breastfeeding among children under age 6 months has increased steadily over time, from 34% in 2012 and 36% in 2017 to 41% in 2023.

### Patterns by background characteristics

- Exclusive breastfeeding among children age 0–5 months generally increases with increasing mother's education, from 31% among those whose mothers have a general basic education to 52% among those whose mothers have a higher education (**Table 11.4**).
- Exclusive breastfeeding among children age 0–5 months is slightly higher in rural areas (42%) than in urban areas (37%). Conversely, mixed milk feeding among children age 0–5 months is less prevalent in rural (21%) than urban (28%) areas.
- Exclusive breastfeeding among children under age 6 months varies widely by region, from 25% in Dushanbe to 51% in Sughd. Mixed milk feeding is highest in Dushanbe (34%).

### 11.3.3 Continued Breastfeeding and Bottle Feeding

Breastfeeding should continue for the first 2 years or beyond because breast milk lowers children's risk of illness, promotes their recovery during illness, and remains an important source of nutrients for healthy growth and development. Longer durations of breastfeeding have many health benefits for women, including reducing risks of certain breast and ovarian cancers and diabetes. The nipple on a feeding bottle is susceptible to contamination and increases the risk of disease among children (WHO and UNICEF 2021). Thus, bottle feeding is not recommended for children under age 2.

**Figure 11.2 Infant feeding practices by age**

Percent distribution of youngest children age 0–5 months

**Continued breastfeeding 12–23 months**

Percentage of children age 12–23 months who were fed breast milk during the previous day.

**Sample:** Children age 12–23 months

**Bottle feeding 0–23 months**

Percentage of children age 0–23 months who were fed from a bottle with a nipple during the previous day.

**Sample:** Children age 0–23 months

Fifty-five percent of children age 12–23 months are currently breastfeeding, with no difference by urban-rural residence. Forty-six percent of children age 0–23 months are bottle fed (**Table 11.4**).

**Patterns by background characteristics**

- The percentage of children age 0–23 months who are bottle fed is higher in urban areas than in rural areas (53% versus 43%) (**Table 11.4**). By region, the percentage varies from 41% in Khatlon to 59% in Dushanbe.
- The percentage of children age 12–23 months who are currently breastfeeding is highest in Khatlon (60%) and lowest in DRS (48%).

**11.3.4 Introduction of Complementary Foods**

After the first 6 months, breast milk alone is no longer sufficient to meet all of the nutritional needs of an infant. After 6 months, appropriate complementary foods should be introduced while breastfeeding is continued until age 2 or older. The transition from exclusive breastfeeding to complementing breastfeeding with family foods is when children are most vulnerable to becoming undernourished. During this time, it is important that children receive solid, semisolid, or soft foods (WHO 2003; WHO and UNICEF 2021).

**Introduction of solid, semisolid, or soft foods 6–8 months**

Percentage of children age 6–8 months who were fed solid, semisolid, or soft foods during the previous day.

**Sample:** Youngest children age 6–8 months living with their mother

Overall, 56% of children were introduced to solid, semisolid, or soft foods at age 6–8 months (**Table 11.10**).

**11.3.5 Minimum Dietary Diversity, Minimum Meal Frequency, Minimum Milk Feeding Frequency, Minimum Acceptable Diet, and Egg and/or Flesh Food Consumption**

Infants and young children should be fed a minimum acceptable diet, which means that they are fed meals with appropriate frequency and a variety of foods to meet their energy and nutrient needs. The minimum acceptable diet indicator is a combination of minimum dietary diversity and minimum meal frequency for breastfeeding children and the same combination along with minimum milk feeding frequency for nonbreastfed children.

Minimum dietary diversity is a proxy for adequate micronutrient density of foods. Consumption of food from at least five groups means that the child has a higher likelihood of consuming at least one animal source of food and at least one fruit or vegetable in addition to a staple food such as grains, roots, or tubers. The five groups should come from a list of eight food groups: breast milk; grains, roots, and tubers;

legumes and nuts; dairy products (milk, yogurt, and cheese); flesh foods (meat, fish, poultry, and organ meat); eggs; vitamin A-rich fruits and vegetables; and other fruits and vegetables.

Minimum meal frequency is a proxy for meeting energy requirements. Breastfed children age 6–8 months are considered to be fed with a minimum meal frequency if they receive solid, semisolid, or soft foods at least twice a day. Breastfed children age 9–23 months are considered to be fed with a minimum meal frequency if they receive solid, semisolid, or soft foods at least three times a day. Nonbreastfed children age 6–23 months are considered to be fed with a minimum meal frequency if they receive solid, semisolid, or soft foods or milk feeds at least four times a day and if at least one of the feeds is a solid, semisolid, or soft food.

Minimum milk feeding frequency is a proxy for meeting the nutrient needs of nonbreastfed children. Milk and milk products are important sources of nutrients. Nonbreastfed children age 6–23 months are considered to be fed with a minimum milk feeding frequency if they receive at least two feeds of milk and/or milk products each day.

Egg and/or flesh food consumption by breastfed and nonbreastfed children age 6–23 months increases energy, protein, and nutrient intake. Eggs, meat, fish, poultry, and organ meats are important sources of nutrients that support healthy child growth (WHO and UNICEF 2021).

#### **Minimum dietary diversity 6–23 months**

Percentage of children age 6–23 months who were fed a minimum of five out of eight defined food groups during the previous day. The eight food groups are as follows: breast milk; grains, roots, and tubers; legumes and nuts; dairy products (milk, yogurt, and cheese); flesh foods (meat, fish, poultry, and organ meat); eggs; vitamin A-rich fruits and vegetables; and other fruits and vegetables.

#### **Minimum meal frequency 6–23 months**

Percentage of children age 6–23 months who were fed solid, semisolid, or soft foods (including milk feeds for non-breastfed children) the minimum number of times or more during the previous day.

#### **Minimum milk feeding frequency 6–23 months**

Percentage of non-breastfed children age 6–23 months who were given at least two milk feeds during the previous day.

#### **Minimum acceptable diet 6–23 months**

Percentage of children age 6–23 months who were fed a minimum acceptable diet during the previous day. This indicator is a composite of children fed with a minimum dietary diversity and a minimum meal frequency, with the additional requirement that nonbreastfed children are fed with a minimum milk feeding frequency.

**Sample:** Youngest children age 6–23 months living with their mother

#### **Egg and/or flesh food consumption 6–23 months**

Percentage of children age 6–23 months who were fed eggs and/or flesh food during the previous day.

**Sample:** Youngest children age 6–23 months living with their mother

Twenty-eight percent of children age 6–23 months received the minimum number of food groups during the day or night prior to the survey (27% of breastfed children and 30% of nonbreastfed children), while 30% were fed the minimum number of times (15% of breastfed children and 62% of nonbreastfed children). Overall, 9% of children were fed a minimum acceptable diet (5% of breastfed children and 19% of nonbreastfed children) (Table 11.8 and Figure 11.3).

Forty-two percent of children age 6–23 months consumed eggs and/or flesh foods during the day or night preceding the survey (Table 11.9).

**Figure 11.3 IYCF indicators on minimum acceptable diet by breastfeeding status**

### Patterns by background characteristics

- Minimum dietary diversity, minimum meal frequency, minimum acceptable diet, and consumption of eggs and/or flesh foods generally increase with increasing mother's education and household wealth (Table 11.8 and Table 11.9).
- By region, minimum dietary diversity ranges from a low of 18% in Khatlon to a high of 46% in Sughd.
- Eleven percent of children in urban areas are fed a minimum acceptable diet, as compared with 8% in rural areas.
- Consumption of eggs and/or flesh food is higher among nonbreastfeeding children (57%) than among breastfeeding children (35%).
- Over half of children in Sughd (58%) consumed eggs and/or flesh food during the day or night preceding the survey, compared with 32%–48% of children in other regions.

### 11.3.6 Sweet Beverage Consumption, Unhealthy Food Consumption, and Zero Vegetable or Fruit Consumption among Children

Unhealthy infant and young child feeding practices should be avoided because they can replace nutritious foods that provide important nutrients for children and promote unhealthy weight gain. For infants and young children, consumption of sweet foods and beverages increases the risk of dental caries and obesity in childhood. In addition, too much salt in the diet increases the risk of noncommunicable diseases, and unhealthy fats and refined carbohydrates contribute to unhealthy weight gain. Children consuming diets low in vegetables and fruits have reduced nutrient intakes, which can negatively impact healthy growth and development; low vegetable and fruit consumption is also associated with noncommunicable diseases later in life. The indicator definition below for unhealthy food consumption describes “sentinel unhealthy foods,” which are foods high in sugar, salt, and/or unhealthy fats that are commonly consumed by infants and young children (WHO and UNICEF 2021).

### Sweet beverage consumption 6–23 months

Percentage of children age 6–23 months who were given a sweet beverage during the previous day.

### Unhealthy food consumption 6–23 months

Percentage of children age 6–23 months who were fed sentinel unhealthy foods during the previous day.

### Zero vegetable or fruit consumption 6–23 months

Percentage of children age 6–23 months who were not fed any vegetables or fruits during the previous day.

**Sample:** Youngest children age 6–23 months living with their mother

Sixty-five percent of children age 6–23 months consumed sweet beverages, 35% consumed unhealthy foods, and 56% did not consume any vegetables or fruits during the day or night preceding the survey (Table 11.9).

### Patterns by background characteristics

- The percentages of children who consumed sweet beverages and unhealthy foods the day before the survey are higher among those who are not breastfeeding (75% and 44%, respectively) than among those who are breastfeeding (60% and 31%, respectively). However, 61% of breastfeeding children did not consume any fruits or vegetables the day or night before the survey, as compared with 44% of nonbreastfeeding children (Figure 11.4).
- There is no difference in unhealthy food consumption by urban-rural residence (35%) (Table 11.9).
- The percentage of children who consume unhealthy foods generally increases with increasing household wealth. In contrast, the percentage who do not consume vegetables or fruits generally decreases with increasing household wealth.

**Figure 11.4 Unhealthy feeding practices among children age 6–23 months by breastfeeding status**

### 11.3.7 Infant and Young Child Feeding (IYCF) Indicators

Table 11.10 summarizes all 17 WHO-UNICEF IYCF indicators.

## 11.4 INFANT AND YOUNG CHILD FEEDING COUNSELING

IYCF counseling helps support appropriate breastfeeding and complementary feeding practices (WHO 2003; WHO 2018). Counseling is an interactive process that helps empower mothers and caregivers to follow the recommended IYCF practices. Counseling can take place in health facilities and the community and is delivered by trained health providers, community health workers, and others in the community.

### Mothers who received IYCF counseling in the past 6 months

Percentage of mothers with children age 6–23 months who received IYCF counseling in the past 6 months from a health care provider or community health worker.

**Sample:** Women whose youngest child age 6–23 months is living with them

Forty-four percent of women with a child age 6–23 months were counseled by a health care provider in the previous 6 months about how or what to feed their child (**Table 11.11**).

### Patterns by background characteristics

- Fifty-nine percent of mothers in urban areas received IYCF counseling, as compared with 39% of mothers in rural areas (**Table 11.11**).
- The percentage of mothers receiving IYCF counseling generally increases with increasing household wealth, from 32% in the lowest wealth quintile to 64% in the highest quintile.
- By region, the percentage of mothers who received IYCF counseling ranges from a low of 30% in Khatlon to a high of 76% in Dushanbe.

## 11.5 ANEMIA IN CHILDREN

Anemia is a condition characterized by an insufficient level of hemoglobin in the blood (Chaparro and Suchdev 2019). Hemoglobin is a protein responsible for transporting oxygen in the blood. In children, anemia can impair cognitive development and is associated with long-term health consequences. When anemia is severe, it can cause death (Chaparro and Suchdev 2019).

### Anemia in children

| Anemia status     | Hemoglobin level in grams/deciliter* |                           |
|-------------------|--------------------------------------|---------------------------|
|                   | Children age 6–23 months             | Children age 24–59 months |
| Anemic            | <10.5                                | <11.0                     |
| Mildly anemic     | 9.5–10.4                             | 10.0–10.9                 |
| Moderately anemic | 7.0–9.4                              | 7.0–9.9                   |
| Severely anemic   | <7.0                                 | <7.0                      |
| Not anemic        | ≥10.5                                | ≥11.0                     |

\* Hemoglobin levels are adjusted for altitude according to WHO 2024.

**Sample:** Children age 6–59 months

In 2024, WHO released new guidelines on hemoglobin cutoffs to define anemia in children and women (WHO 2024). In addition, the guidelines have updated the methodology for making altitude and cigarette smoking adjustments to hemoglobin levels. The new guidelines also recommend using venous blood to measure hemoglobin levels. This is because recent evidence shows that the type of blood source (e.g., venous blood or capillary blood) can result in different hemoglobin levels and anemia estimates (Hackl et al. 2024; Namaste et al. 2024; Neufeld et al. 2019; Stevens et al. 2022). Hemoglobin levels (and anemia estimates) based on different blood source types should not be compared.

The results for children presented in this report use the new cutoffs to define anemia and have been adjusted for altitude according to the latest WHO guidance.<sup>1</sup> However, at the time of survey data collection, single-drop capillary blood was still recommended and was used to measure hemoglobin (see Chapter 1) (WHO 2011c). Therefore, caution is advised when interpreting the anemia estimates in this survey and any others that have used single-drop capillary blood. In addition, it is not advisable to examine trends in anemia prevalence estimates derived using different blood testing methods, adjustment factors, or hemoglobin cutoffs.

Anemia testing using capillary blood was successfully completed for 96% of eligible children (Appendix C, **Table C.6**). Overall, 35% of children age 6–59 months are anemic. Most children have mild anemia (24%). Eleven percent have moderate anemia, and less than 1% have severe anemia (**Table 11.12**).

### Patterns by background characteristics

- The percentage of children with anemia ranges widely among the regions, from 31% in Dushanbe to 55% in GBAO (**Map 11.2**).
- The mean hemoglobin level among children age 6–23 months (10.8 g/dl) is lower than that among children age 24–59 months (11.3 g/dl) (**Table 11.12**).
- The percentage of children with anemia is higher in rural areas (37%) than in urban areas (32%).
- The percentage of children with anemia declines with increasing household wealth, from 40% in the lowest wealth quintile to 28% in the highest wealth quintile.

### Map 11.2 Anemia in children by region

Percentage of children age 6–59 months with any anemia

<sup>1</sup> Anemia estimates based on the 2024 WHO guidelines are expected to result in lower anemia estimates for children age 6–23 months compared to estimates derived from the 2011 guidelines. For children age 24–59 months, anemia estimates are expected to be higher than under the 2011 WHO guidelines. For reference, **Table C.16** and **Table C.17** in Appendix C include the anemia estimates based on the 2011 WHO guidelines.

## 11.6 MICRONUTRIENT SUPPLEMENTATION AMONG CHILDREN

Micronutrient deficiency is a major contributor to childhood morbidity and mortality. Micronutrient deficiency can be caused by a lack of consumption of foods that supply vitamins and minerals, as well as by infections and genetic abnormalities. Strategies to prevent or address micronutrient deficiency include agricultural approaches such as biofortification, food-based approaches that can be complemented with food fortification, and, for specific life stages and population groups, direct micronutrient supplementation (USAID 2019).

Iron is a micronutrient that plays an important role in numerous biological systems. Iron deficiency is one of the primary causes of anemia. Interventions targeting iron deficiency and anemia include periodically giving children iron tablets or syrup (WHO 2011a; WHO 2016a; WHO 2016b).

Vitamin A is a micronutrient that supports the immune system and plays an important role in maintaining the epithelial tissue in the body. Severe vitamin A deficiency can cause eye damage, increase the severity of infections such as those causing measles, and slow recovery from illness. Vitamin A supplementation programs help reduce vitamin A deficiency and mortality in children (WHO 2011b).

### **Iron tablets or syrup**

Percentage of children age 6–59 months who were given iron tablets or syrup in the past 12 months.

**Sample:** Children age 6–59 months

### **Vitamin A supplements**

Percentage of children age 6–59 months who were given vitamin A supplements in the past 6 months.

**Sample:** Children age 6–59 months

Overall, 56% of children age 6–59 months were given iron-containing supplements in the past 12 months and 72% were given vitamin A supplements in the past 6 months (**Table 11.13**).

### **Patterns by background characteristics**

- The percentages of children given vitamin A supplements and iron-containing supplements increase with increasing household wealth.
- The percentages of children receiving iron-containing supplements and vitamin A supplements are higher in urban areas (66% and 78%, respectively) than in rural areas (53% and 70%, respectively).
- By region, the percentage of children given iron-containing supplements is lowest in Sughd (50%) and highest in Dushanbe (79%). The percentage of children receiving vitamin A supplements ranges from 67% in Khatlon to 86% in GBAO.

## 11.7 WOMEN'S NUTRITIONAL STATUS

Chronic energy deficiency is caused by eating too little or having an unbalanced diet that lacks adequate nutrients. Women of reproductive age (age 15–49) are especially vulnerable to chronic energy deficiency and malnutrition due to low dietary intakes, inequitable distribution of food within the household, improper food storage and preparation, dietary taboos, infectious diseases, and inadequate care practices. Chronic energy deficiency leads to low productivity among adults and greater morbidity and mortality (WHO 1995). In addition, undernutrition among women is a major risk factor for adverse birth outcomes. Overweight and obesity have adverse health outcomes as well. Overweight and obesity are major risk factors for several chronic diseases, including diabetes, cardiovascular diseases, and cancer.

Body mass index (BMI) is the ratio of weight relative to height squared; it is used to measure nutritional status among adults age 20–49. BMI values are independent of age and sex. Adult women age 20–49 whose height is less than 145 centimeters are classified as being of short stature.

BMI-for-age, the ratio of weight relative to height for different age groups, is used to measure nutritional status among children and adolescents age 5–19 (WHO 2007). BMI-for-age is sex and age specific. The reason is that adolescents are still growing, and the timing of peak growth velocity differs in boys and girls. In the DHS surveys, BMI-for-age is reported among adolescents age 15–19. Similarly, short stature among adolescent women (age 15–19) is assessed according to low height-for-age.

### Body mass index (BMI)

BMI is calculated by dividing weight in kilograms by height in meters squared ( $\text{kg/m}^2$ ).

| Adult status        | BMI                           |
|---------------------|-------------------------------|
| Too thin for height | Less than 18.5                |
| Normal              | Between 18.5 and 24.9         |
| Overweight          | Between 25.0 and 29.9         |
| Obese               | Greater than or equal to 30.0 |

**Sample:** Women age 20–49 who are not pregnant and who have not had a birth in the 2 months before the survey

### BMI-for-age

BMI-for-age is measured in z score standard deviations (SD).

| Adolescent status   | BMI-for-age             |
|---------------------|-------------------------|
| Too thin for height | Less than -1 SD         |
| Normal              | Between -1 SD and +1 SD |
| Overweight          | Between +1 SD and +2 SD |
| Obese               | Greater than +2 SD      |

**Sample:** Women age 15–19 who are not pregnant and who have not had a birth in the 2 months before the survey

### Short stature

Percentage of women age 20–49 with height under 145 cm.

**Sample:** Women age 20–49

Percentage of women age 15–19 with height-for-age z score less than -2 SD.

**Sample:** Women age 15–19

Height and weight data were collected for 99% of eligible women age 15–49 (Appendix C, **Table C.6**). During measurements, 17% of women had hairstyles or ornamentation that interfered with height measurement, and 7% of women were not wearing lightweight clothing or wore heavy permanent ornaments that interfered with weight measurement (Appendix C, **Table C.11**).

Among women age 20–49, data on height and weight were used to calculate two measures of nutritional status: height and BMI. Overall, 1% of women are shorter than 145 cm. Three percent of women are thin, while 50% are overweight or obese (**Table 11.14.1** and **Figure 11.5**).

Among adolescent women age 15–19, data on height, weight, and age were used to calculate two measures of nutritional status: height-for-age and BMI-for-age. Overall, 9% of young women are of short stature, 11% are thin, and 12% are overweight or obese (**Table 11.14.2** and **Figure 11.5**).

**Figure 11.5 Nutritional status of adolescent and adult women**

*Percent distribution of women age 15–19 and 20–49 by nutritional status*

### Patterns by background characteristics

- Among women age 20–49, overweight or obesity increases with age, from 31% among women age 20–29 to 69% among women age 40–49 (**Table 11.14.1**).
- The percentage of women age 20–49 classified as thin is higher in GBAO (9%) than in the other regions (3%–4%) (**Table 11.14.1**).
- Among adolescent women age 15–19, the percentage who are overweight or obese is highest in Sughd (14%) and lowest in GBAO (9%) (**Table 11.14.2**).

## 11.8 WOMEN'S DIETARY PRACTICES

Dietary practices that support a healthy diet include eating a variety of different foods and food groups and limiting consumption of sugary beverages and unhealthy foods. Eating a variety of unprocessed foods helps women consume the appropriate amount of essential vitamins and minerals. A healthy diet also protects against overweight, obesity, and noncommunicable diseases.

Minimum dietary diversity for women is an indicator of diet diversity validated for nonpregnant women age 15–49. The indicator is based on 10 food groups: grains, white/pale starchy roots, tubers, and plantains; pulses (beans, peas, and lentils); nuts and seeds; dairy (milk and milk products); flesh foods (meat, fish, poultry, and organ meat); eggs; dark green leafy vegetables; vitamin-A rich fruits and vegetables; other vegetables; and other fruits. Women who consumed at least five of the 10 possible food groups in the 24 hours before the survey were classified as having minimally adequate dietary diversity. Deficiencies in micronutrients such as iron, iodine, vitamin A, folate, and zinc can have devastating consequences for the human body. Women, particularly those of childbearing age, are especially vulnerable due to their greater needs for essential vitamins and minerals. Having minimally adequate dietary diversity is important for micronutrient adequacy (FAO 2021).

Unhealthy foods and sweet beverages should be limited because they are associated with overweight, obesity, and noncommunicable diseases (Askari et al. 2020). Overweight and obesity among women can affect reproductive health and increase complications in pregnancy (Mitchell and Shaw 2015). The indicator for unhealthy food consumption describes “sentinel unhealthy foods,” which are fried foods or foods high in sugar, salt, and/or unhealthy fats that are commonly consumed by women (FAO 2021).

### Minimum dietary diversity for women

Percentage of women who consumed foods from at least five out of 10 defined food groups during the previous day. The 10 food groups are as follows: grains, white/pale starchy roots, tubers, and plantains; pulses (beans, peas, and lentils); nuts and seeds; dairy (milk and milk products); flesh foods (meat, fish, poultry, and organ meat); eggs; dark green leafy vegetables; vitamin-A rich fruits and vegetables; other vegetables; and other fruits.

**Sample:** Women age 15–49

### Sweet beverage consumption

Percentage of women who consumed sweet beverages during the previous day.

**Sample:** Women age 15–49

### Unhealthy food consumption

Percentage of women who consumed selected sentinel unhealthy foods during the previous day.

**Sample:** Women age 15–49

The most commonly consumed foods among women age 15–49 are those made from grains (99%); roots, tubers, and plantains (90%); and meat, fish, poultry, and organ meat (86%). The foods consumed least often are fried and salty foods (15%) and sodas, malt drinks, sports drinks, and energy drinks (27%) (**Table 11.15**). Overall, 87% of women age 15–49 consumed foods from at least five of the 10 defined food groups during the day or night preceding the survey, while 95% consumed sweet beverages and 67% consumed unhealthy foods (**Table 11.16**).

### Patterns by background characteristics

- Minimum dietary diversity among women is greater than 80% across all regions and ranges from 82% in Khatlon to 95% in Sughd.
- Unhealthy food consumption increases as household wealth increases, from 49% among women in the lowest wealth quintile to 78% among those in the highest wealth quintile. The same pattern is observed with education; the percentage of women consuming unhealthy foods increases from 54% among those with no education or a primary education to 74% among those with a higher education (**Table 11.16**).

## 11.9 ANEMIA IN WOMEN

Anemia in adults can cause fatigue, lethargy, reduced physical productivity, and poor work performance (Chaparro and Suchdev 2019). Anemia is a major concern among pregnant women because it can lead to increased maternal mortality and poor birth outcomes (Haider et al. 2013).

| Anemia in women   |                                      |                          |                  |                 |
|-------------------|--------------------------------------|--------------------------|------------------|-----------------|
| Anemia status     | Hemoglobin level in grams/deciliter* |                          |                  |                 |
|                   | Nonpregnant women age 15–49          | Pregnant women age 15–49 |                  |                 |
|                   |                                      | First trimester          | Second trimester | Third trimester |
| Anemic            | <12.0                                | <11.0                    | <10.5            | <11.0           |
| Mildly anemic     | 11.0–11.9                            | 10.0–10.9                | 9.5–10.4         | 10.0–10.9       |
| Moderately anemic | 8.0–10.9                             | 7.0–9.9                  | 7.0–9.4          | 7.0–9.9         |
| Severely anemic   | <8.0                                 | <7.0                     | <7.0             | <7.0            |
| Not anemic        | ≥12.0                                | ≥11.0                    | ≥10.5            | ≥11.0           |

\* Hemoglobin levels are adjusted for cigarette smoking and for altitude according to WHO 2024.

**Sample:** Women age 15–49

As described in Section 11.5, WHO released new guidelines on the preferred blood source for measuring hemoglobin, the methodology for adjusting hemoglobin levels for altitude and cigarette smoking, and the hemoglobin cutoffs used to define anemia (WHO 2024).<sup>2</sup> Under this new guidance, the cutoffs to define anemia among pregnant women have changed.

The results for women presented in this report use the new cutoffs to define anemia and have been adjusted for altitude and cigarette smoking according to the latest WHO guidelines. However, since single-drop capillary blood rather than venous blood was used to measure hemoglobin (see Chapter 1), caution is advised when interpreting the anemia estimates in this survey and any others that have used single-drop capillary blood. In addition, it is not advisable to examine trends in anemia prevalence estimates derived using different blood testing methods, adjustment factors, or hemoglobin cutoffs.

Anemia testing using capillary blood was successfully completed for 96% of eligible women (Appendix C, **Table C.6**). Overall, 36% of women age 15–49 were classified as anemic. The majority of women have mild anemia (21%). Fourteen percent have moderate anemia, and less than 1% have severe anemia (**Table 11.17**).

### Patterns by background characteristics

- The prevalence of severe anemia is higher among women who have given birth to six or more children (3%) than among women who have given birth to five or fewer children (1%) (**Table 11.17**).
- The percentage of women with anemia is lower in urban areas (33%) than in rural areas (37%).
- Anemia prevalence decreases with increasing household wealth, from 38% among women in the lowest wealth quintile to 33% among those in the highest quintile.
- By region, the percentage of women with anemia is lowest in Dushanbe (28%) and highest in GBAO (42%).

<sup>2</sup> Anemia estimates based on the 2024 WHO guidelines are expected to result in lower anemia estimates for pregnant women in the second trimester compared to estimates derived from the 2011 guidelines. For nonpregnant women and pregnant women in the first and third trimesters, anemia estimates are expected to be higher than under the 2011 WHO guidelines. For reference, **Table C.16** and **Table C.17** in Appendix C include the anemia estimates based on the 2011 WHO guidelines.

## 11.10 PRESENCE OF IODIZED SALT IN HOUSEHOLDS

Iodine is a micronutrient that plays an important role in thyroid function, which is critical for reproductive function, growth, and development. It is recommended that household salt be fortified with iodine. Sufficient iodine prevents goiter, brain damage, and other thyroid-related health problems (WHO 2014b).

### Household salt iodization

Percentage of households with iodized salt.

**Sample:** Households in which salt was tested for iodine content

In Tajikistan, salt is fortified with potassium iodate. The 2023 TjDHS tested for the presence of potassium iodate in salt available in the household using a rapid test kit. Among households with tested salt, 84% had iodized salt. Less than 1% of households did not have salt on the day of the survey (**Table 11.18**).

### Patterns by background characteristics

- The percentage of households with iodized salt is higher in urban than rural areas (91% versus 81%).
- By region, the percentage of households with iodized varies from a low of 75% in GBAO to a high of 97% in Dushanbe.
- The percentage of households with iodized salt increases with increasing wealth, from 76% in the lowest wealth quintile to 93% in the highest wealth quintile.

## LIST OF TABLES

For more information on nutrition of children and women, see the following tables:

- **Table 11.1**      **Nutritional status of children**
- **Table 11.2**      **Child growth monitoring**
- **Table 11.3**      **Early breastfeeding**
- **Table 11.4**      **Breastfeeding status according to age**
- **Table 11.5**      **Infant feeding practices by age**
- **Table 11.6**      **Liquids consumed by children in the day or night preceding the interview**
- **Table 11.7**      **Foods consumed by children in the day or night preceding the interview**
- **Table 11.8**      **Minimum dietary diversity, minimum meal frequency, and minimum acceptable diet among children**
- **Table 11.9**      **Egg and/or flesh food consumption and unhealthy feeding practices among children age 6–23 months**
- **Table 11.10**     **Infant and young child feeding (IYCF) indicators**
- **Table 11.11**     **Infant and young child feeding counseling**

Note: Each of the indices is expressed in standard deviation units (SD) from the median of the WHO Child Growth Standards. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Recumbent length is measured for children under age 2; standing height is measured for all other children.

<sup>2</sup> Includes children who are below -3 SD from the WHO Child Growth Standards population median

<sup>3</sup> Excludes children whose mothers were not interviewed

<sup>4</sup> First-born twins (triplets, etc.) are counted as first births because they do not have a previous birth interval.

<sup>5</sup> Information available only for children age 0–35 months

<sup>6</sup> Includes children whose mothers are deceased

<sup>7</sup> Excludes children whose mothers were not weighed and measured, children whose mothers were not interviewed, and children whose mothers are pregnant or gave birth within the preceding 2 months. Mother's nutritional status is defined using body mass index (BMI) for mothers age 20–49 and BMI-for-age for mothers age 15–19 (as presented in Tables 11.14.1 and 11.14.2).

<sup>8</sup> For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the Household Questionnaire.

**Table 11.2 Child growth monitoring**

Percentage of children under age 5 who had selected measurements performed by a health care provider in the 3 months preceding the survey, according to background characteristics, Tajikistan DHS 2023

| Background characteristic       | Weight | Height | Mid-upper-arm circumference (MUAC) | Weight and height | Weight, height, and MUAC | Number of children |
|---------------------------------|--------|--------|------------------------------------|-------------------|--------------------------|--------------------|
| <b>Age in months</b>            |        |        |                                    |                   |                          |                    |

Note: Table is based on children born in the 2 years preceding the survey regardless of whether the children were living or dead at the time of the interview. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

ANC = antenatal care

PNC = postnatal care

<sup>1</sup> Children given nothing other than breast milk to eat or drink during the first 2 days after delivery

<sup>2</sup> Information available for the most recent live birth only

<sup>3</sup> Doctor, nurse, or midwife

<sup>4</sup> Women were asked about counseling on breastfeeding by any health care provider in the first 2 days after their most recent live birth regardless of where they gave birth.

**Table 11.4 Breastfeeding status according to age**

Among youngest children age 0–5 months living with their mother, percentage exclusively breastfeeding and percentage receiving mixed milk feeding; among all children age 12–23 months, percentage currently breastfeeding; and among all children age 0–23 months, percentage using a bottle with a nipple, according to background characteristics, Tajikistan DHS 2023

| Background characteristic   | Among youngest children age 0–5 months living with their mother: |                                                      |                    | Among all children age 12–23 months:            |                    | Among all children age 0–23 months:     |                    |

Note: Breastfeeding status refers to a “24-hour” period (yesterday during the day or at night). Figures in parentheses are based on 25–49 unweighted cases. na = not applicable

<sup>1</sup> Received breast milk and infant formula and/or animal milk. Excludes yogurt drinks because they are generally not fed as a substitute for breast milk.

<sup>2</sup> Corresponds to the IYCF indicator “continued breastfeeding”

**Table 11.5 Infant feeding practices by age**

Percent distribution of youngest children age 0–5 months living with their mother by feeding category, according to age in months, Tajikistan DHS 2023

| Age group in months | Breast milk only (exclusively breastfed) | Breast milk and plain water only | Breast milk and non-milk liquids <sup>1</sup> | Breast milk and animal milk and/or infant formula <sup>2</sup> | Breast milk and solid, semisolid, or soft foods <sup>3</sup> | Not breastfed | Unknown <sup>4</sup> | Total | Number of youngest children 0–5 months living with their mother |

Note: Breastfeeding status refers to a “24-hour” period (yesterday during the day or at night). The categories of breast milk only, breast milk and plain water only, breast milk and non-milk liquids, breast milk and formula and/or animal milk, breast milk and solid, semisolid, or soft foods, and not breastfed are hierarchical and mutually exclusive. When combined with children whose feeding category is classified as unknown due to “don’t know” responses, the percentages in each row add to 100%.

<sup>1</sup> Children fed breast milk along with non-milk liquids (e.g., juice, herbal tea, sweetened water, flavored water). Children in this category may have also been fed plain water.

<sup>2</sup> Children fed breast milk along with animal milk, infant formula, and/or animal milk-based yogurt drinks. Children in this category may have also been fed non-milk liquids and/or plain water.

<sup>3</sup> Children fed breast milk along with solid, semisolid, or soft food from any food group (e.g., grains, meat, eggs, fruits, vegetables). Children in this category may have also been fed plain water, non-milk liquids, and/or animal milk, infant formula, and animal milk-based yogurt drinks.

<sup>4</sup> Not classified elsewhere due to “don’t know” responses

**Table 11.6 Liquids consumed by children in the day or night preceding the interview**

Percentage of youngest children under age 2 living with their mother by type of liquids consumed in the day or night preceding the interview, according to age and breastfeeding status, Tajikistan DHS 2023

| Age in months             | Plain water | Infant formula <sup>1</sup> | Animal milk |                 | Yogurt drinks |                 | Fruit juice or fruit-flavored drinks | Sodas, malt drinks, sports drinks, or energy drinks | Tea, coffee, or herbal drinks |            | Clear broth or clear soup | Other liquids |            | Number of youngest children under age 2 living with their mother |

Note: Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Infant formula includes NAN, Nutrilac, Malutka, and Malysh.

**Table 11.7 Foods consumed by children in the day or night preceding the interview**

Percentage of youngest children under age 2 living with their mother by type of foods consumed in the day or night preceding the interview, according to age and breastfeeding status, Tajikistan DHS 2023

| Age in months             | Grains | Roots, tubers, and plantains | Pulses (beans, peas, lentils), nuts, and seeds | Dairy products (milk, infant formula, yogurt, cheese) | Flesh foods (meat, fish, poultry, organ meats) | Eggs   | Vitamin A-rich fruits and vegetables | Other fruits and vegetables | Sweet foods <sup>1</sup> | Fried and salty foods <sup>2</sup> | Other solid, semisolid, and soft food | Number of youngest children under age 2 living with their mother |

Note: See the Woman's Questionnaire for list of liquids and foods. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Sentinel sweet foods such as chocolates, candies, pastries, cakes, biscuits, ice cream, or popsicles

<sup>2</sup> Sentinel fried and salty foods such as chips, crisps, puffs, French fries, fried dough, or instant noodles

**Table 11.8 Minimum dietary diversity, minimum meal frequency, and minimum acceptable diet among children**

Percentage of youngest children age 6–23 months living with their mother who are fed a minimum acceptable diet based on breastfeeding status, number of food groups, and times they are fed during the day or night preceding the survey, according to background characteristics, Tajikistan DHS 2023

| Background characteristic | Among youngest breastfed children age 6–23 months living with their mother, percentage fed: |                                     |                                      |                                              | Among youngest nonbreastfed children age 6–23 months living with their mother, percentage fed: |                                        |                                     |                                      | Among all youngest children age 6–23 months living with their mother, percentage fed: |                                        |                                     |                                      |                                        |

Note: Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Minimum dietary diversity is receiving foods from five or more of the following eight food groups: a. breast milk; b. grains, white/pale starchy roots, tubers, and plantains; c. beans, peas, lentils, nuts, and seeds; d. dairy products (tinned, powdered, or fresh animal milk; infant formula; yogurt; cheese); e. flesh foods (meat, fish, poultry, organ meats); f. eggs; g. vitamin A-rich fruits and vegetables; h. other fruits and vegetables.

<sup>2</sup> For breastfed children, minimum meal frequency is receiving solid, semisolid, or soft food at least twice a day for infants age 6–8 months and at least three times a day for children age 9–23 months.

<sup>3</sup> For breastfed children, minimum acceptable diet is being fed with a minimum dietary diversity (footnote 1) and a minimum meal frequency (footnote 2).

<sup>4</sup> For nonbreastfed children, minimum milk feeding frequency is two or more feedings of infant formula; tinned, powdered, or fresh animal milk; and liquid or solid yogurt.

<sup>5</sup> For nonbreastfed children, minimum meal frequency is receiving solid, semisolid, or soft food or milk feeds at least four times a day. At least one of the feeds must be a solid, semisolid, or soft feed.

<sup>6</sup> For nonbreastfed children, minimum acceptable diet is being fed with a minimum dietary diversity (footnote 1), a minimum milk feeding frequency (footnote 4), and a minimum meal frequency (footnote 5).

<sup>7</sup> Minimum meal frequency is receiving the minimum recommended number of feeds per day according to age and breastfeeding status as defined in footnotes 2 and 5.

<sup>8</sup> Minimum acceptable diet is being fed with a minimum dietary diversity (footnote 1), a minimum meal frequency (footnotes 2 and 5), and a minimum milk feeding frequency (footnote 4).

**Table 11.9 Egg and/or flesh food consumption and unhealthy feeding practices among children age 6–23 months**

Percentage of youngest children age 6–23 months living with their mother who consumed eggs and/or flesh food, and percentage who experienced each specified unhealthy feeding practice, during the day or night preceding the survey, according to background characteristics, Tajikistan DHS 2023

| Background characteristic    | Eggs and/or flesh foods (meat, fish, poultry, organ meats) | Unhealthy feeding practices: |                             |                                        | Number of youngest children age 6–23 months living with their mother |

Note: Table is based on children who stayed in the household on the night before the interview and who were tested for anemia. Anemia classifications are based on cutoffs applied to hemoglobin levels that have been adjusted for altitude (WHO 2024). Hemoglobin is measured in grams per deciliter (g/dl) using the HemoCue 201+ device. Figures in parentheses are based on 25–49 unweighted cases.

<sup>1</sup> Includes children whose mothers are deceased

<sup>2</sup> For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the Household Questionnaire.

**Table 11.13 Micronutrient supplementation among children**

Among children age 6–59 months, percentages who were given iron tablets or syrup in the past 12 months, and percentage who were given vitamin A supplements in the past 6 months, according to background characteristics, Tajikistan DHS 2023

| Background characteristic               | Among children age 6–59 months:                                       |                                                                      |                    |

Note: Body mass index (BMI) is expressed as the ratio of weight in kilograms to the square of height in meters (kg/m<sup>2</sup>) for adults age 20–49.

<sup>1</sup> Excludes pregnant women and women with a birth in the preceding 2 months

**Table 11.14.2 Nutritional status of adolescent women age 15–19**

Among women age 15–19, percentage with height-for-age below –2 standard deviations (SD), mean body mass index (BMI)-for-age z score, and percentage with specific BMI-for-age levels, according to background characteristics, Tajikistan DHS 2023

Note: Height-for-age and body mass index (BMI)-for-age are expressed in standard deviation units (SD) from the median of the WHO Growth Reference for adolescent women age 15–19. Figures in parentheses are based on 25–49 unweighted cases.

<sup>1</sup> Excludes pregnant women and women with a birth in the preceding 2 months

<sup>2</sup> Includes adolescent women age 15–19 who are below –2 standard deviations (SD) from the WHO Growth Reference population median

<sup>3</sup> Includes adolescent women age 15–19 who are above +2 standard deviations (SD) from the WHO Growth Reference population median

**Table 11.15 Foods and liquids consumed by women in the day or night preceding the interview**

Percentage of women age 15–49 by type of foods and liquids consumed in the day or night preceding the interview, according to background characteristics, Tajikistan DHS 2023

| Background characteristic   | Grains | Roots, tubers, and plantains | Pulses (beans, peas, lentils) | Nuts and seeds | Dairy products (milk, cheese, yogurt) | Flesh foods (meat, fish, poultry, organ meats) | Eggs | Dark green leafy vegetables | Vitamin A-rich fruits and vegetables | Other vegetables | Other fruits | Sweet foods <sup>1</sup> | Fried and salty foods <sup>2</sup> | Fruit juice and fruit-flavored drinks, kompot, or mors | Sodas, malt drinks, sports drinks, and energy drinks | Sweetened tea, coffee, herbal drinks, and other sweet beverages <sup>3</sup> | Number of women |

Note: Salt was tested for the presence of potassium iodate.

## Key Findings

- **Knowledge of HIV or AIDS:** 78% of women age 15–49 have heard of HIV or AIDS, an increase from 53% in the 2017 TjDHS.
- **Discriminatory attitudes towards people living with HIV:** 72% of women who have heard of HIV or AIDS expressed discriminatory attitudes towards people living with HIV.
- **HIV testing:** 70% of women who gave birth in the 2 years preceding the survey were tested for HIV during either antenatal care (ANC) or labor and received the results.
- **Self-reported prevalence of STIs:** 8% of women who had ever had sexual intercourse reported having had a sexually transmitted infection (STI) and/or STI symptoms in the 12 months preceding the survey.
- **Knowledge of HIV prevention methods among young women:** Only 10% of women age 15–24 are knowledgeable about HIV prevention.

This chapter presents information on the current status of HIV knowledge, attitudes, and testing coverage among all women age 15–49 and young women age 15–24.

## 12.1 KNOWLEDGE OF HIV OR AIDS

Nearly 8 in 10 women age 15–49 (78%) have heard of HIV or AIDS (**Table 12.1**), a substantial increase from 53% in the 2017 TjDHS.

### Patterns by background characteristics

- Eighty percent of ever-married women have heard of HIV or AIDS, as compared with 67% of never-married women.
- By region, the percentages of women who have heard of HIV or AIDS are highest in Dushanbe (94%) and Gorno-Badakhshan Autonomous Oblast (GBAO) (90%) and lowest in Khatlon (77%) and Districts of Republican Subordination (DRS) (62%).
- Knowledge of HIV or AIDS increases with increasing education, from 65% among women with no education or a primary education to 91% among women with a higher education.

## 12.2 KNOWLEDGE AND ATTITUDES ABOUT MEDICINES TO TREAT OR PREVENT HIV

Antiretroviral medicines, or ARVs, are a powerful tool in the fight against HIV. ARVs are taken by people living with HIV to keep them healthy by preventing the virus from progressing to AIDS. By taking ARVs, individuals living with HIV also greatly reduce the risk of passing the virus on to others. Women living with HIV who take ARVs during pregnancy and breastfeeding reduce the chances of passing the virus on to their children. In addition, people who are HIV negative can take ARVs to reduce their chances of

acquiring HIV. This is called preexposure prophylaxis, or PrEP. Knowledge about and positive attitudes towards these treatment and prevention measures help to promote their use and prevent transmission of HIV.

Thirty-six percent of women have heard of ARVs, 27% know that the risk of mother-to-child transmission (MTCT) can be reduced by the mother taking special drugs, and 27% have heard of PrEP (Table 12.2 and Figure 12.1). Of women who have heard of PrEP, 56% approve of people taking PrEP to prevent acquiring HIV.

**Trends:** The percentage of women age 15–49 who know that the risk of MTCT can be reduced by the mother taking special drugs decreased from 23% in 2012 to 20% in 2017 before increasing to 27% in 2023 (Figure 12.2).

### Patterns by background characteristics

- The percentage of women who have heard of ARVs is higher in urban areas than in rural areas (44% versus 33%). Similarly, 31% of women in urban areas and 26% in rural areas know that the risk of MTCT can be reduced by the mother taking special drugs, and 34% and 24%, respectively, have heard of PrEP. Among women who have heard of PrEP, there is little difference by residence in the percentage who approve of people who take PrEP (57% in urban areas and 55% in rural areas).
- Knowledge of ARVs, knowledge that the risk of MTCT can be reduced by the mother taking special drugs, and knowledge of PrEP all increase with increasing education, with the largest percentage increases occurring between the general secondary and professional primary levels.

**Figure 12.1 Knowledge of medicines to treat HIV or prevent HIV transmission**

**Figure 12.2 Trends in knowledge of mother-to-child transmission (MTCT)**

## 12.3 DISCRIMINATORY ATTITUDES TOWARDS PEOPLE LIVING WITH HIV

Widespread stigma and discrimination in a population can adversely affect both people's willingness to be tested and their adherence to antiretroviral therapy (ART). Thus, reduction of stigma and discrimination in a population is an important indicator of the success of programs targeting HIV prevention and control.

### Discriminatory attitudes towards people living with HIV

Women were asked two questions to assess discriminatory attitudes towards people living with HIV. Respondents with discriminatory attitudes towards people living with HIV are those who say that they would not buy fresh vegetables from a shopkeeper or vendor if they knew that person had HIV or who say that children living with HIV should not be allowed to attend school with children who do not have HIV.

**Sample:** Women age 15–49 who have heard of HIV or AIDS

Seventy-two percent of women who have heard of HIV or AIDS expressed discriminatory attitudes towards people living with HIV (**Table 12.3**). Sixty-six percent of women did not think that children living with HIV should be able to attend school with children who are HIV negative, an increase from 52% in 2017.

### Patterns by background characteristics

- The percentages of women with discriminatory attitudes toward people living with HIV are lowest in Dushanbe and GBAO (52% and 50%, respectively) and highest in Sughd and DRS (78% and 77%, respectively).
- Discriminatory attitudes decrease with increasing education. Eighty percent of women with no education or a primary education have discriminatory attitudes towards people living with HIV, as compared with 62% of women with a higher education (**Figure 12.3**).

## 12.4 MULTIPLE SEXUAL PARTNERS

Less than 1% of women had two or more sexual partners in the past 12 months. The mean lifetime number of sexual partners among women is 1.1 (**Table 12.4**).

## 12.5 COVERAGE OF HIV TESTING SERVICES

HIV testing programs diagnose people living with HIV so that they can be linked to care and access antiretroviral therapy (ART). Knowledge of HIV status helps HIV-negative individuals reduce their risk and remain negative.

### 12.5.1 HIV Testing of Pregnant Women

Sixty percent of women who gave birth in the 2 years preceding the survey had an HIV test during antenatal care (ANC) and received the test results (**Table 12.5**). Seventy percent of women were tested for HIV during either ANC or labor and received the results. A higher percentage of women in Dushanbe (85%) and GBAO (87%) than in Khatlon (68%) and DRS (57%) were tested for HIV during ANC or labor and received the results. The percentage of women who had an HIV test and received the results increases with both increasing education and increasing household wealth.

**Figure 12.3 Discriminatory attitudes towards people living with HIV by education**

*Percentage among women age 15–49 who have heard of HIV*

Note: Respondents have discriminatory attitudes if they do not think that children living with HIV should be able to attend school with children who are HIV negative or would not buy fresh vegetables from a shopkeeper who has HIV.

## 12.5.2 Experience with Prior HIV Testing

Forty-nine percent of women have ever been tested for HIV, and almost all of these women received their test results. Nineteen percent of women were tested for HIV in the 12 months preceding the survey and received the results of the most recent test (Table 12.6 and Figure 12.4). Eleven percent of women have been tested for HIV once in their life, 12% have been tested twice, and 27% have been tested three or more times (Table 12.7).

**Trends:** The percentage of women who have ever been tested for HIV and received the results increased from 13% in 2012 to 48% in 2023 (Figure 12.5).

### Patterns by background characteristics

- The percentage of women who have ever been tested for HIV and received results increases with increasing education, from 40% among those with no education or a primary education to 64% among those with a professional primary/middle education or a higher education (Figure 12.6).

**Figure 12.4 HIV testing**

Percentage of women age 15–49

**Figure 12.5 Trends in HIV testing**

Percentage of women age 15–49 who have ever been tested for HIV and received the results

**Figure 12.6 HIV testing by education**

Percentage of women age 15–49 who have ever been tested for HIV and received results

- By region, the percentage of women who have ever been tested and received results is higher in GBAO (69%) and Dushanbe (68%) than in Sughd (52%), Khatlon (47%), and DRS (37%) (**Map 12.1**).

**Map 12.1 HIV testing among women by region**

*Percentage of women age 15–49 who have ever been tested for HIV and received the results*

- The percentage of women who have been tested for HIV in the past 12 months and received the results is higher among those age 20–24 (31%) than among those in the other age groups (**Table 12.6**).

### *Knowledge and Coverage of Self-testing*

Eighteen percent of women have ever heard of HIV self-test kits. However, only 6% of women have used an HIV self-test kit (**Table 12.8**). The percentage of women who have heard about and used HIV self-test kits is higher among those with a professional primary/middle education (31% and 11%, respectively) than among those in the other education groups. Knowledge of HIV self-test kits increases with increasing household wealth (from 13% in the lowest wealth quintile to 25% in the highest quintile), but personal use varies little according to wealth (5%–6%).

## **12.6 SELF-REPORTING OF SEXUALLY TRANSMITTED INFECTIONS**

### **Sexually transmitted infections (STIs) and symptoms**

Respondents who have ever had sex were asked whether they had an STI or symptoms of an STI (a bad-smelling, abnormal discharge from the vagina or a genital sore or ulcer) in the 12 months before the survey.

**Sample:** Women age 15–49 who have ever had sex

Eight percent of women who had ever had sexual intercourse reported having had a sexually transmitted infection (STI) and/or STI symptoms in the 12 months preceding the survey (**Table 12.9**). The percentage of women who reported having had an STI and/or symptoms of an STI is higher among those who have never been married (11%) than among those who are currently married (8%) or divorced, separated, or widowed (7%). The percentage of women who reported ever having had an STI and/or symptoms of an STI is much higher among those from GBAO (18%) than among those from other regions.

## 12.7 KNOWLEDGE AND BEHAVIOR RELATED TO HIV AND AIDS AMONG YOUNG WOMEN

This section addresses HIV-related knowledge among young women age 15–24 and also assesses the extent to which young women engage in behaviors that may place them at risk of acquiring HIV.

### 12.7.1 Knowledge about HIV Prevention

#### Knowledge about HIV prevention

Knowing that consistent use of condoms during sexual intercourse and having just one uninfected faithful partner can reduce the chances of getting HIV, knowing that a healthy-looking person can have HIV, and rejecting two major misconceptions about HIV transmission: HIV can be transmitted by mosquito bites and a person can become infected by sharing food with a person who has HIV.

**Sample:** Women age 15–24

Knowledge of how HIV is transmitted is crucial in enabling people to avoid HIV infection, and this is especially true for young people, who are often at greater risk because they may have shorter relationships with more partners or engage in other risky behaviors. Only 10% of women age 15–24 are knowledgeable about HIV prevention (Table 12.10 and Figure 12.7).

#### Patterns by background characteristics

- Twelve percent of ever-married young women have knowledge about HIV prevention, as compared with 8% of never-married young women.
- A higher percentage of young women in Dushanbe (13%), Sughd (14%), and GBAO (17%) than in DRS (5%) and Khatlon (8%) have knowledge about HIV prevention.
- The percentage of young women who have knowledge about HIV prevention is higher among those with a professional primary/middle education (17%) than among those in the other education groups (7–14%).

**Figure 12.7 Knowledge about HIV prevention among young women**

### 12.7.2 First Sex

Young women who initiate sex at an early age are typically at higher risk of becoming pregnant or contracting an STI than young women who initiate sex later. Consistent condom use can reduce such risks. Less than 1% of women age 15–24 had sexual intercourse before age 15. A slightly higher percentage of young women (6%) had sexual intercourse before age 18 (Table 12.11).

## Patterns by background characteristics

- The percentage of young women who reported having sexual intercourse before age 18 increases from 9% among those with no education or a primary education to 13% among those with a general basic education and then decreases with increasing education.
- The percentage of young women who had sexual intercourse before age 18 is slightly higher in rural areas (6%) than in urban areas (4%).

### 12.7.3 Premarital Sex

Nearly all (more than 99%) never-married women age 15–24 have never had sexual intercourse (**Table 12.12**).

### 12.7.4 Multiple Sexual Partners

Less than 1% of women age 15–24 had two or more sexual partners in the past 12 months, and less than 1% had sex with a person who neither was their husband nor lived with them (**Table 12.13**).

### 12.7.5 Recent HIV Testing

Seeking an HIV test may be more difficult for young people than adults because many young people lack experience in accessing health services for themselves and because there are often barriers to young people obtaining services. Thirty-eight percent of women age 15–24 who had sex in the 12 months preceding the survey were tested for HIV in the past 12 months and received the results of the most recent test (**Table 12.14**).

**Trends:** The percentage of sexually active young women who were tested for HIV in the past 12 months and received the results of the most recent test increased from 10% in 2012 to 19% in 2017 and 38% in 2023.

## LIST OF TABLES

For more information on knowledge, attitudes, and behavior related to HIV and AIDS, see the following tables:

- **Table 12.1 Knowledge of HIV or AIDS**
- **Table 12.2 Knowledge of and attitudes about medicines to treat HIV or prevent HIV transmission**

Note: An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

**Table 12.3 Discriminatory attitudes towards people living with HIV**

Among women age 15–49 who have heard of HIV or AIDS, percentage who do not think that children living with HIV should be able to attend school with children who are HIV negative, percentage who would not buy fresh vegetables from a shopkeeper who has HIV, and percentage with discriminatory attitudes towards people living with HIV, according to background characteristics, Tajikistan DHS 2023

| Background characteristic      | Percentage who do not think that children living with HIV should be able to attend school with children who are HIV negative | Percentage who would not buy fresh vegetables from a shopkeeper who has HIV | Percentage with discriminatory attitudes towards people living with HIV <sup>1</sup> | Number of women who have heard of HIV or AIDS |

Note: Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Means are calculated excluding respondents who gave non-numeric responses.

**Table 12.5 Pregnant women tested for HIV**

Among all women age 15–49 who gave birth in the 2 years preceding the survey, percentage who received an HIV test during antenatal care (ANC) for their most recent birth by whether they received their results and percentage who received an HIV test during ANC or labor for their most recent birth by whether they received their results, according to background characteristics, Tajikistan DHS 2023

| Background characteristic  | Percentage who were tested for HIV during ANC and who: |                         | Percentage who had an HIV test during ANC or labor and who: <sup>1</sup> |                         | Number of women who gave birth in the past 2 years <sup>2</sup> |

Note: Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Women were asked whether they received an HIV test during labor only if they gave birth in a health facility.

<sup>2</sup> Denominator for percentages includes women who did not receive antenatal care for their most recent birth in the past 2 years.

**Table 12.6 Coverage of prior HIV testing**

Percent distribution of women age 15–49 by HIV testing status and by whether they received the results of the most recent test, percentage of women ever tested, and percentage of women who were tested in the past 12 months and received the results of the most recent test, according to background characteristics, Tajikistan DHS 2023

| Background characteristic  | Percent distribution of women by testing status and by whether they received the results of the most recent test |                                      |                           | Total | Percent-age ever tested | Percent-age who have been tested for HIV in the past 12 months and received the results of the most recent test | Number of women |

**Table 12.10 Knowledge about HIV prevention among young women**

Percentages of young women age 15–24 who, in response to prompted questions, say that people can reduce their risk of getting HIV by using condoms every time they have sexual intercourse and by having one sex partner who is not infected and has no other partners, that a healthy-looking person can have HIV, that HIV cannot be transmitted by mosquito bites, and that a person cannot get HIV by sharing food with a person who has HIV, and percentage with knowledge about HIV prevention, according to background characteristics, Tajikistan DHS 2023

Note: An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Knowledge about HIV prevention means knowing that consistent use of condoms during sexual intercourse and having just one uninfected faithful partner can reduce the chance of getting HIV, knowing that a healthy-looking person can have HIV, and rejecting two major misconceptions about HIV transmission: HIV can be transmitted by mosquito bites and a person can become infected by sharing food with a person who has HIV.

**Table 12.11 Age at first sexual intercourse among young women**

Percentage of young women age 15–24 who had sexual intercourse before age 15 and percentage of young women age 18–24 who had sexual intercourse before age 18, according to background characteristics, Tajikistan DHS 2023

| Background characteristic   | Women age 15–24                                     |                 | Women age 18–24                                     |                 |

Note: An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

### Key Findings

- **Experience of violence:** 12% of women in Tajikistan age 15–49 have experienced physical violence since age 15, and 2% have ever experienced sexual violence. One percent of women who have ever been pregnant have experienced violence during pregnancy.
- **Controlling behaviors:** 80% of women who have ever had a husband/intimate partner have experienced controlling behaviors from their husband/intimate partner, and 25% have experienced three or more controlling behaviors.
- **Intimate partner violence by current or most recent husband/partner:** 16% of women who have ever had a husband or intimate partner have experienced physical, sexual, or emotional violence by their current or most recent partner.
- **Violence by any intimate partner in the past 12 months:** 14% of women who have ever had one or more husbands or intimate partners experienced emotional, physical, or sexual violence by a husband or intimate partner in the past 12 months.
- **Injuries due to intimate partner violence:** 31% of women who have ever experienced violence committed by their current or most recent husband/intimate partner have sustained injuries.
- **Help seeking:** Only 23% of women who have ever experienced physical or sexual violence sought help or told someone.

Gender-based violence is defined by the United Nations as any act of violence that results in physical, sexual, or psychological harm or suffering to women, girls, men, and boys, as well as threats of such acts, coercion, or the arbitrary deprivation of liberty. Increasing research has highlighted the health burdens, intergenerational effects, and demographic consequences of such violence (United Nations 2006).

A common form of gender-based violence is intimate partner violence, which refers to behavior within an intimate relationship that causes physical, sexual, or psychological harm and includes acts of physical aggression, sexual coercion, psychological abuse, and controlling behavior. This definition of intimate partner violence covers violence by both current and former spouses and partners.<sup>1</sup> This chapter focuses on intimate partner violence and other forms of domestic violence.

Historically, The DHS Program has collected detailed information only on intimate partner violence experienced by ever-married women, defined as women who are currently married or living with a man as if married and women who were formerly married or lived with a man as if married. More recently, the questionnaire module used to capture intimate partner violence in a DHS survey was revised to also capture intimate partner violence experienced by never-married women who reported that they currently or

<sup>1</sup> <https://apps.who.int/violence-info/intimate-partner-violence>.

formerly had an intimate partner. In the 2023 Tajikistan DHS, the revised version of the domestic violence questionnaire module was used for the first time, and therefore indicators on intimate partner violence are reported for women who have ever had a husband or other intimate partner. In the context of the revised questionnaire module and this report, the term “boyfriend” excludes anyone reported as an intimate partner. Given these changes, when examining trends in intimate partner violence, only the estimates provided separately for ever-married women should be compared with corresponding estimates from previous surveys.

The 2023 TjDHS implemented the module of questions on domestic violence in accordance with the World Health Organization’s guidelines on the ethical collection of information on domestic violence (WHO 2001). Only one eligible woman per household was randomly selected for the module, and the module was not implemented if privacy could not be obtained. Of the 6,787 women age 15–49 who were eligible for the module, 6,448 were successfully interviewed; 309 could not complete the module due to privacy concerns and 30 were not interviewed for other reasons. Special weights were used to adjust for the selection of only one woman per household and to ensure that the domestic violence subsample was nationally representative.

### 13.1 MEASUREMENT OF VIOLENCE

#### Terminology for this chapter

**Husband:** a man with whom a woman is married or living with as if married.

**Intimate partner:** a man with whom a never-married woman is in a relationship that involves physical and/or emotional intimacy and for which the relationship is or has the expectation of being longer lasting. As defined for the purposes of this chapter, an intimate partner is not a husband or a man a woman is living with and is also not a boyfriend with whom her relationship is casual or a man with whom she has a one-time encounter.

**Husband/intimate partner:** the current husband for currently married women; the most recent husband for divorced, separated, or widowed women; the current intimate partner for never-married women who currently have an intimate partner; and the most recent intimate partner for never-married women who do not currently have an intimate partner but had one in the past.

**Boyfriend:** a man with whom a woman has a casual relationship and who she did not mention as an intimate partner.

In the 2023 TjDHS, information was obtained from women age 15–49 on their experience of violence committed by any perpetrator, including current and former husbands or other intimate partners. To capture intimate partner violence, ever-married women were asked about their experience of violence committed by their current and former husbands/live-in partners, and, if applicable, never-married women were asked about their experience of violence committed by their current and former intimate partners. More specifically, intimate partner violence was measured by asking women if their current or former husband/intimate partner ever did the following to them:

- **Physical violence:** push you, shake you, or throw something at you; slap you; twist your arm or pull your hair; punch you with his fist or with something that could hurt you; kick you, drag you, or beat you up; choke you or burn you on purpose; or attack you with a knife, gun, or other weapon
- **Sexual violence:** physically force you to have sexual intercourse with him when you did not want to, physically force you to perform any other sexual acts you did not want to, or force you with threats or in any other way to perform sexual acts you did not want to
- **Emotional violence:** say or do something to humiliate you in front of others, threaten to hurt or harm you or someone you care about, or insult you or make you feel bad about yourself

In addition to the questions on different forms of intimate partner violence, information was also obtained from all women about physical violence committed by anyone other than any husband/intimate partner since they were age 15 by asking if anyone had hit, slapped, kicked, or done something else to hurt them physically. Similarly, women were asked if they had experienced sexual violence committed by anyone other than any husband/intimate partner. Specifically, they were asked if at any time in their life, as a child or as an adult, they were forced in any way to have sexual intercourse or to perform any other sexual acts when they did not want to. Additionally, women who had ever been pregnant were asked about their experience of physical violence during any pregnancy.

## 13.2 WOMEN'S EXPERIENCE OF PHYSICAL VIOLENCE

### Physical violence by any perpetrator

Percentage of women who have experienced any physical violence (committed by a husband, intimate partner, or anyone else) since age 15 and in the 12 months before the survey.

**Sample:** Women age 15–49

Twelve percent of women age 15–49 have experienced physical violence since age 15, including 9% who experienced physical violence often or sometimes in the 12 months preceding the survey (**Table 13.1**). Only 2% of women who have never been married and never had an intimate partner reported experiencing physical violence since age 15 (**Table 13.1**); however, 3% of these women refused to answer whether they had experienced physical violence since age 15 (data not shown separately).

**Trends:** The percentage of women who have experienced physical violence since age 15 has decreased over the past decade, from 19% in 2012 to 12% in 2023. However, the data suggest that this pattern has not been uniform over the decade, with the percentage increasing from 19% to 24% between 2012 and 2017 and then falling sharply to 12% in 2023.

### Patterns by background characteristics

- The percentage of women who have experienced physical violence since age 15 increases sharply from 4% among those age 15–19 to 17% among those age 30–39 before dropping to 13% among those age 40–49 (**Table 13.1**).
- By region, women's experience of physical violence since age 15 varies from a low of 7% in Dushanbe to a high of 18% in Khatlon.
- Twenty-eight percent of divorced, separated, or widowed women; 13% of currently married women; and 2% of women who have never been married and never had an intimate partner reported experiencing physical violence since age 15 (**Figure 13.1**).
- Women's experience of physical violence since age 15 is generally lower among those with more education, declining from 14% among those with no education or a primary education to 12% among those with a higher education. The difference between educational groups is more noticeable with respect to experience of violence during the past 12 months, with the percentage declining from 11% among those with no education to 8% among those with a higher education.

**Figure 13.1 Women's experience of violence by marital status**

### 13.2.1 Perpetrators of Physical Violence

Among women who had ever been married or had an intimate partner and who had experienced physical violence since age 15, 83% reported their current husband or intimate partner as the perpetrator. The next most common perpetrator mentioned by these women was their former husband or intimate partner (17%). Two percent of all women who reported any physical violence since age 15 mentioned experiencing violence by a mother or stepmother, and 2% reported violence by a sibling (**Table 13.2**).

### 13.2.2 Experience of Physical Violence during Pregnancy

#### Physical violence during pregnancy

Percentage of women who have experienced physical violence (committed by a husband, intimate partner, or anyone else) during any pregnancy.

**Sample:** Women age 15–49 who have ever been pregnant

Among women age 15–49 who had ever been pregnant, 1% reported experiencing physical violence while pregnant (**Table 13.3**).

#### Patterns by background characteristics

- Among women who had ever been married, the prevalence of physical violence during pregnancy was much higher among those who were divorced, separated or widowed (5%) than among those who were currently married (1%).

## 13.3 EXPERIENCE OF SEXUAL VIOLENCE

#### Sexual violence by any perpetrator

Percentage of women who have experienced any sexual violence (committed by a husband, intimate partner, or anyone else) ever and in the 12 months before the survey.

**Sample:** Women age 15–49

### 13.3.1 Prevalence of Sexual Violence

Two percent of women age 15–19 have ever experienced sexual violence by any perpetrator, and 1% experienced such violence in the past 12 months (**Table 13.4**). Notably, while less than 1% of never-married women reported any sexual violence, 3% of them refused to answer the question regarding sexual violence (data not shown separately<sup>2</sup>).

**Trends:** The percentage of women who have ever experienced sexual violence has decreased over the past decade, from 4% in 2012 to 2% in 2017 and 2023. Trends in experience of sexual violence in the past 12 months are similar, with a slight decline from 2012 to 2017 and no subsequent change (**Table 13.4**).

#### Patterns by background characteristics

- The percentage of women who have ever experienced sexual violence increases with age, from 0% among those age 15–19 to 3% among those age 30–39 and age 40–49. The pattern with respect to experience of sexual violence in the past 12 months is similar (**Table 13.4**).
- The percentage of women who have ever experienced sexual violence is broadly similar across regions, ranging from 1% in Dushanbe and Districts of Republican Subordination (DRS) to 2% in

---

<sup>2</sup> Nonresponse for sexual violence by an intimate partner is not available.

Sughd and Khatlon. Again, the pattern with respect to experience of sexual violence in the past 12 months is similar.

- Two percent of women who have ever been married reported ever experiencing sexual violence, as compared with less than 1% of those who have never been married. A higher percentage of divorced, separated, or widowed women (11%) than currently married women (2%) reported ever experiencing sexual violence.
- The percentage of women who have ever experienced sexual violence is higher among those who are employed for cash (5%) than among those who are employed but not for cash (3%) and those who are not employed (1%). Two percent of women who are employed for either cash or not for cash experienced sexual violence in the past 12 months, compared with 1% of those who are not employed.

### 13.3.2 Perpetrators of Sexual Violence

Among women who had ever been married or had an intimate partner and had experienced sexual violence, 84% reported their current husband or intimate partner as the perpetrator, and 19% reported a former husband or intimate partner. Among all women age 15–49 who had experienced sexual violence, 7% reported a current or former boyfriend as the perpetrator (**Table 13.5**).

### 13.3.3 Experience of Sexual Violence by a Non-intimate Partner

Less than 1% of women age 15–49 had experienced sexual violence from someone other than a current or former husband or intimate partner. Notably, however, although the figures are still very low, the percentage of women reporting sexual violence by a non-intimate partner is higher among those age 20–24 and 30–39 than among those in the other age groups (**Table 13.6**).

**Table 13.6** also shows data on nonresponse to the question regarding experience of sexual violence committed by a non-intimate partner. Overall, 2% of women refused to answer the question. The percentage was highest among women who had never been married (3%) and women in Khatlon (4%).

### 13.3.4 Age at First Experience of Sexual Violence

**Table 13.7** shows that 1% of women age 15–49 had experienced sexual violence by any perpetrator by age 22; no women had experienced such violence at age 15 or younger. While the differences are relatively small, the percentages of women experiencing sexual violence at specific ages are higher if the perpetrator was a current or former husband or intimate partner than if he was a non-intimate partner.

## 13.4 EXPERIENCE OF DIFFERENT FORMS OF VIOLENCE

Physical violence or sexual violence may not occur in isolation; rather, women may experience a combination of forms of violence, and these combinations of violence can have a long-lasting negative effect on women's lives, health, and well-being. Among all women, 10% have experienced physical violence only, less than 1% have experienced sexual violence only, and 2% have experienced both physical and sexual violence. Overall, 12% of women have experienced either physical or sexual violence. The percentage of women who have experienced physical or sexual violence increases from 4% among those age 15–19 to a peak of 18% among those age 30–39 before falling to 13% among those age 40–49 (**Table 13.8**).

## 13.5 FORMS OF CONTROLLING BEHAVIORS AND INTIMATE PARTNER VIOLENCE

### Controlling behavior

Percentage of women whose current or most recent husband/intimate partner demonstrates one or more controlling behaviors.

**Sample:** Women age 15–49 who ever had a husband or an intimate partner

### Intimate partner violence

Percentage of women who have experienced any of the specified acts of physical, sexual, or emotional violence committed by their current or most recent husband/intimate partner, ever and in the 12 months preceding the survey.

**Sample:** Women age 15–49 who ever had a husband or an intimate partner

### 13.5.1 Prevalence of Controlling Behaviors and Intimate Partner Violence

Controlling behaviors can be important warning signs of difficulties in intimate relationships and may be correlated with intimate partner violence. While specific types of controlling behaviors may be important to examine, the combination is often more significant.

#### Controlling Behaviors

The 2023 TjDHS results show that 80% of women age 15–49 who have ever had a husband/intimate partner have experienced at least one controlling behavior from their husband/intimate partner, and 77% experienced at least one such behavior in the past 12 months (**Table 13.9**). The most common controlling behaviors reported by women were jealousy or anger if they talk to other men (73%) and insisting on knowing where they are at all times (56%). Twenty-five percent of women reported that their husband/intimate partner does not permit them to meet their female friends, 10% said that he has tried to limit their contact with their family, and 8% reported that he had wrongly accused them of being unfaithful (**Figure 13.2**). Overall, 25% of women reported experiencing at least three of the specified behaviors (**Table 13.10**).

**Trends:** The percentage of ever-married women who have experienced three or more controlling behaviors from their current or most recent husband/partner increased from 19% in 2012 to 29% in 2017 before decreasing to 25% in 2023.

**Figure 13.2 Forms of controlling behaviors**

*Percentage of women age 15–49 who have ever had a husband/intimate partner and have experienced specific types of controlling behaviors*

#### Patterns by background characteristics

- The percentage of women whose husband or intimate partner had ever displayed three or more controlling behaviors was highest among those age 15–19 (30%) and lowest among those age 40–49 (21%) (**Table 13.10**).
- By region, the percentage of women reporting that their husband or intimate partner had ever displayed three or more controlling behaviors ranges from 18% in Gorno-Badakhshan Autonomous

Oblast (GBAO) to 28% in DRS. There are large differences by region for the individual controlling behaviors as well. For example, 42% of women in GBAO reported that their husbands were jealous or angry if they talked to other men, as compared with more than 70% in Dushanbe (73%), Khatlon (76%), and Sughd (78%).

- Twenty-two percent of women with a general secondary education reported experiencing three or more controlling behaviors, as compared with 30% of women with no education or a primary education. The percentage of women who reported that their husband/intimate partner wrongly accused them of being unfaithful and insisted on knowing where they are at all times is highest among those with a higher education.
- The percentage of women who reported ever experiencing three or more controlling behaviors increases from 22% among those in the lowest wealth quintile to 26% those in the highest quintile.
- Ten percent of women who are never afraid of their husband/intimate partner reported experiencing three or more controlling behaviors, compared with 21% of those who are sometimes afraid of their husband/partner and 42% of those who are afraid of their husband/intimate partner most of the time.

### *Violence by Current or Most Recent Husband/Intimate Partner*

Fourteen percent of women who have ever had a husband/intimate partner reported having experienced physical violence from their current or most recent husband/intimate partner, including 11% who experienced physical violence in the past 12 months; 2% reported having ever experienced sexual violence, including 1% who experienced such violence in the past 12 months; and 7% reported having experienced emotional violence, including 6% who experienced such violence in the past 12 months. Overall, 16% of women have experienced one or more forms of physical, sexual, or emotional violence from their current or most recent husband/intimate partner, including 14% in the past 12 months (**Table 13.9**).

Women who had experienced physical violence most commonly reported being slapped (11%), those who had experienced sexual violence most often reported being physically forced to have sexual intercourse when they did not want to (2%), and those who had experienced emotional violence most commonly reported that their husband or partner said or did something to humiliate them in front of others (5%) (**Figure 13.3**).

**Trends:** Over the past decade, levels of reported physical, sexual, and emotional violence have declined in Tajikistan. However, the decline has not been consistent across this period, with an increase between 2012 and 2017 followed by a sharp decrease between 2017 and 2023. In 2012, 24% of women reported experiencing physical, sexual, or emotional violence perpetrated by their husbands. This percentage increased to 31% in 2017 and then declined to 16% in 2023. The overall decline is mostly due to large decreases in the percentage of women reporting both physical and emotional violence.

**Figure 13.3 Forms of intimate partner violence**

*Percentage of women age 15–49 who have ever had a husband/intimate partner and have experienced specific acts of violence by their most recent husband/intimate partner*

#### Patterns by background characteristics

- The percentage of women who have experienced physical, sexual, or emotional violence from their current or most recent husband/intimate partner is lowest among those age 20–24 (12%) and highest among those age 30–39 (20%) (**Table 13.11**).

- There is considerable variation by region in women's experience of intimate partner violence; 10% of women in DRS have experienced physical, sexual, or emotional violence from their current or most recent husband/intimate partner, as compared with 24% of women in Khatlon (**Map 13.1**).

### Map 13.1 Intimate partner violence by region

*Percentage of women age 15–49 who ever had a husband/intimate partner and have ever experienced physical, sexual, or emotional violence committed by their most recent husband/intimate partner*

- Thirty-one percent of women who are divorced, separated, or widowed have experienced any of the three forms of violence, more than twice the percentage among women who are currently married or living with their partner (15%).

### Patterns by husband's/intimate partner's characteristics and women's empowerment indicators

- The likelihood of experiencing physical, sexual, or emotional violence increases with husbands'/intimate partners' alcohol consumption. Fourteen percent of women whose husband/intimate partner does not drink have ever experienced any of the three types of violence, as compared with 44% of those whose husband/intimate partner is sometimes drunk and 76% of those whose husband/intimate partner is often drunk (**Figure 13.4** and **Table 13.12**).
- Women's experience of physical, sexual, or emotional violence increases with their husbands'/intimate partners' education. Twelve percent of women whose husband/intimate partner has no education or a primary education have experienced physical, sexual or emotional violence, compared with 18%–19% of women whose husband/intimate partner has a professional primary/middle or higher education.

### Figure 13.4 Intimate partner violence by husband's/intimate partner's alcohol consumption

*Percentage of women who have ever had a husband/intimate partner and have ever experienced emotional, physical, or sexual violence by their most recent husband/intimate partner*

- There is a strong relationship between the number of controlling behaviors displayed by a woman's husband or intimate partner and her experience of physical, sexual, or emotional violence. The percentage of women who have experienced any of the three types of violence increases from 3% among those whose husband or intimate partner displays no controlling behaviors to 13% among those whose husband displays one or two behaviors, 30% among those whose husband displays three or four behaviors, and 73% among those whose husband displays all five behaviors.
- The percentage of women who are victims of intimate partner violence is much higher among those who reported that their fathers beat their mothers (50%) than among those who reported that their fathers did not beat their mothers (14%).
- Five percent of women who are never afraid of their husband/intimate partner have ever experienced violence, compared with 14% of those who are sometimes afraid and 30% of those who are afraid most of the time.

### 13.5.2 Intimate Partner Violence in the Past 12 Months Perpetrated by Any Husband/Intimate Partner

#### **Intimate partner violence by any partner in the past 12 months**

Percentage of women who experienced any of the specified acts of physical, sexual, or emotional violence committed by any husband or any intimate partner in the 12 months preceding the survey. These indicators correspond to SDG 5.2.1.

**Sample:** Women age 15–49 who ever had a husband or an intimate partner

Fourteen percent of women who have ever had one or more husbands/intimate partners experienced physical, sexual, or emotional violence by a husband/intimate partner in the past 12 months; 6% experienced emotional violence, 11% experienced physical violence, and 1% experienced sexual violence (Table 13.13).

## 13.6 INJURIES TO WOMEN DUE TO INTIMATE PARTNER VIOLENCE

#### **Injuries due to intimate partner violence**

Percentage of women who have the following types of injuries from intimate partner violence: cuts, bruises, or aches; eye injuries, sprains, dislocations, or burns; or deep wounds, broken bones, broken teeth, or any other serious injury.

**Sample:** Women age 15–49 who have experienced physical or sexual violence committed by their current or most recent husband or intimate partner

Thirty-one percent of women age 15–49 who have ever experienced physical or sexual violence by their current or most recent husband/intimate partner have sustained injuries. The most commonly reported injuries are cuts, bruises, or aches (30%); 12% of women experienced eye injuries, sprains, dislocations, or burns, and 4% experienced deep wounds, broken bones, broken teeth, or any other serious injury (Table 13.14).

## 13.7 VIOLENCE INITIATED BY WOMEN AGAINST THEIR HUSBAND/INTIMATE PARTNER

#### **Initiation of physical violence by women**

Percentage of women who have ever hit, slapped, kicked, or done anything else to physically hurt their current or most recent husband/intimate partner at times when he was not already beating or physically hurting them.

**Sample:** Women age 15–49 who ever had a husband or an intimate partner

One percent of women age 15–49 who have ever had a husband/intimate partner have ever initiated physical violence against their current or most recent husband/intimate partner when he was not already beating or physically hurting them. One percent initiated such violence in the past 12 months. Three percent of women who have themselves experienced intimate partner physical violence have ever initiated such violence, as compared with less than 1% of women who have not experienced physical intimate partner violence (**Table 13.15**).

**Table 13.16** presents data on initiation of physical violence by women against their husband/intimate partner by the husband's/intimate partner's characteristics and women's empowerment indicators.

### 13.8 HELP SEEKING AMONG WOMEN WHO HAVE EXPERIENCED VIOLENCE

Overall, only 23% of women age 15–49 who have ever experienced physical or sexual violence sought help to stop the violence or told someone about it. The percentage of women who have sought help is higher among those who have experienced both physical and sexual violence (26%) than among those who have experienced only physical violence (9%) (**Table 13.17** and **Figure 13.5**).

**Figure 13.5 Help seeking by type of violence experienced**

*Percentage of women age 15–49 who have experienced physical or sexual violence and sought help*

#### Patterns by background characteristics

- More women from urban areas (16%) sought help than women from rural areas (9%). Similarly, more women from urban (15%) than rural (11%) areas told someone about the violence.
- Help-seeking behavior varies greatly by region: 7% of women living in Khatlon sought help, as compared with 27% of those living in Dushanbe. In other regions, the percentage of women who sought help ranged from 11% to 15%.
- Help seeking does not vary consistently with household wealth or education. Notably, however, more women from households in the highest wealth quintile sought help (18%) than women from households in the other quintiles.

#### Sources for Help

Among women who have experienced physical or sexual violence and sought help, the most common source of help is their own family (64%), followed by their husband's/intimate partner's family (43%). Few women sought help from a friend (7%), a lawyer (5%), or the police (3%) (**Table 13.18**).

Note: An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Includes physical violence in the past 12 months. For women who were married or living together before age 15 and reported violence only by their husband and for never-married women who had an intimate partner before age 15 and reported violence only by their intimate partner, the violence could have occurred before age 15.

<sup>2</sup> Includes women who reported physical violence in the past 12 months but for whom frequency is not known

**Table 13.2 Persons committing physical violence**

Among women age 15–49 who have experienced physical violence since age 15, percentage who report specific persons who committed the violence, by the respondent's partnership status, Tajikistan DHS 2023

Note: The term husband includes a partner with whom a woman is living as if married. Husband/intimate partner refers to the current husband for currently married women; the most recent husband for divorced, separated, or widowed women; the current intimate partner for never-married women who currently have an intimate partner; and the most recent intimate partner for never-married women who do not currently have an intimate partner but had one in the past.

Note: The term husband includes a partner with whom a woman is living as if married. Husband/intimate partner refers to the current husband for currently married women; the most recent husband for divorced, separated, or widowed women; the current intimate partner for never-married women who currently have an intimate partner; and the most recent intimate partner for never-married women who do not currently have an intimate partner but had one in the past. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

**Table 13.11 Intimate partner violence by background characteristics**

Percentage of women age 15–49 who have ever had a husband or intimate partner and have ever experienced emotional, physical, or sexual violence committed by their current or most recent husband/intimate partner, according to background characteristics, Tajikistan DHS 2023

| Background characteristic            | Emotional violence | Physical violence | Sexual violence | Physical and sexual | Physical and sexual and emotional | Physical or sexual | Physical or sexual or emotional | Number of women who ever had a husband/intimate partner |

Note: The term husband includes a partner with whom a woman is living as if married. Husband/intimate partner refers to the current husband for currently married women; the most recent husband for divorced, separated, or widowed women; the current intimate partner for never-married women who currently have an intimate partner; and the most recent intimate partner for never-married women who do not currently have an intimate partner but had one in the past. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

**Table 13.12 Intimate partner violence by husband's/intimate partner's characteristics and women's empowerment indicators**

Percentage of women age 15–49 who have ever had a husband or intimate partner and have ever experienced emotional, physical, or sexual violence committed by their current or most recent husband/intimate partner, according to the husband's/intimate partner's characteristics and women's empowerment indicators, Tajikistan DHS 2023

| Background characteristic                                                                | Emotional violence | Physical violence | Sexual violence | Physical and sexual | Physical and sexual and emotional | Physical or sexual | Physical or sexual or emotional | Number of women who ever had a husband/intimate partner |

Note: The term husband includes a partner with whom a woman is living as if married. Husband/intimate partner refers to the current husband for currently married women; the most recent husband for divorced, separated, or widowed women; the current intimate partner for never-married women who currently have an intimate partner; and the most recent intimate partner for never-married women who do not currently have an intimate partner but had one in the past. Total includes 1 woman whose husband's education and spousal education difference are missing. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Includes only currently married women

<sup>2</sup> According to the wife's report. Includes only currently married women. See Table 14.7 for list of decisions.

<sup>3</sup> According to the woman's report. See Table 13.9 for list of behaviors.

<sup>4</sup> According to the woman's report. See Table 14.8 for list of reasons.

**Table 13.13 Violence by any husband or intimate partner in the past 12 months**

Percentage of women age 15–49 who have ever had a husband or intimate partner and experienced emotional, physical, or sexual violence by any husband/intimate partner in the past 12 months, according to background characteristics, Tajikistan DHS 2023

| Background characteristic            | Emotional violence | Physical violence | Sexual violence | Physical and sexual | Physical and sexual and emotional | Physical or sexual | Physical or sexual or emotional | Number of women who ever had a husband/intimate partner |

Note: The term husband includes a partner with whom a woman is living as if married. Any husband/intimate partner includes all current, most recent, and former husbands for ever-married women and all current, most recent, and former intimate partners for never-married women. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

**Table 13.14 Injuries to women due to intimate partner violence**

Among women age 15–49 who have ever had a husband or intimate partner and have experienced violence committed by their current or most recent husband/intimate partner, percentage who have been injured as a result of the violence, by types of injuries, according to type of violence, Tajikistan DHS 2023

| Type of violence experienced                   | Cuts, bruises, or aches | Eye injuries, sprains, dislocations, or burns | Deep wounds, broken bones, broken teeth, or any other serious injury | Any of these injuries | Number of women who have experienced specified type of violence |
|------------------------------------------------|-------------------------|-----------------------------------------------|----------------------------------------------------------------------|-----------------------|-----------------------------------------------------------------|

Note: The term husband includes a partner with whom a woman is living as if married. Husband/intimate partner refers to the current husband for currently married women; the most recent husband for divorced, separated, or widowed women; the current intimate partner for never-married women who currently have an intimate partner; and the most recent intimate partner for never-married women who do not currently have an intimate partner but had one in the past.

<sup>1</sup> Excludes women who reported violence only in response to a direct question on violence during pregnancy

<sup>2</sup> Includes in the past 12 months

**Table 13.15 Violence by women against their husband/intimate partner by women's background characteristics**

Percentage of women age 15–49 who have ever had a husband or intimate partner and have committed physical violence against their current or most recent husband/intimate partner when he was not already beating or physically hurting them, ever and in the past 12 months, according to women's own experience of intimate partner violence and background characteristics, Tajikistan DHS 2023

| Background characteristic                                       | Percentage who committed physical violence against their husband/intimate partner |                | Number of women who ever had a husband/intimate partner |

Note: The term husband includes a partner with whom a woman is living as if married. Husband/intimate partner refers to the current husband for currently married women; the most recent husband for divorced, separated, or widowed women; the current intimate partner for never-married women who currently have an intimate partner; and the most recent intimate partner for never-married women who do not currently have an intimate partner but had one in the past. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Includes in the past 12 months

**Table 13.16 Violence by women against their husband/intimate partner by husband's/intimate partner's characteristics and women's empowerment indicators**

Percentage of women age 15–49 who have ever had a husband or intimate partner and have committed physical violence against their current or most recent husband/intimate partner when he was not already beating or physically hurting them, ever and in the past 12 months, according to their husband's/intimate partner's characteristics and women's empowerment indicators, Tajikistan DHS 2023

| Background characteristic                                                                | Percentage who committed physical violence against their husband/intimate partner |                | Number of women who ever had a husband/intimate partner |
